Subject: 2020 Olympic Track and Field Trials Focused Traffic Study

1. INTRODUCTION

This memorandum presents Iteris' assessment of the potential traffic impacts related to the 2020 Olympic Track and Field Trials (OTFT) to be held at the new stadium on the campus of Mt. SAC, located in the City of Walnut. This report contains the evaluation of intersection traffic operations in the existing conditions and operations with a fully attended event (20,000 guests). The OTFT event is planned to occur during the month of June, coinciding with Mt. SAC's summer intersession. The weekday p.m. peak hour is analyzed as part of this report, representing the worst-case time period when the last OTFT event of the day would conclude.

The following nineteen (19) intersections are analyzed as part of this report, consistent with the locations analyzed for the 2015 Facilities Master Plan Update (FMPU), and illustrated in **Figure 1**:

1. Nogales Street/Amar Road;
2. Lemon Avenue/Amar Road;
3. Grand Avenue/I-10 Westbound Ramp;
4. Grand Avenue/I-10 Eastbound Ramp;
5. Grand Avenue/Cameron Avenue;
6. Grand Avenue/Mountaineer Road;
7. Grand Avenue/San Jose Hills Road;
8. Grand Avenue/Temple Avenue;
9. Grand Avenue/La Puente Road;
10. Grand Avenue/Valley Boulevard;
11. Grand Avenue/Baker Parkway;
12. Grand Avenue/SR-60 Westbound Ramps;
13. Grand Avenue/SR-60 Eastbound Ramps;
14. Mt. SAC Way/Temple Avenue;
15. Bonita Avenue/Temple Avenue;
16. Lot F/Temple Avenue;
17. Valley Boulevard/Temple Avenue;
18. SR-57 Southbound Ramps/Temple Avenue; and
19. SR-57 Northbound Ramps/Temple Avenue.

Two OTFT traffic/parking scenarios are assessed in this report. The first scenario, Plan A, assumes that approximately 30% of the event attendees park off campus at remote parking lots and hotels, and take shuttles to and from the stadium. The shuttles would also provide service to Ontario International Airport. The other 70% of attendees would park on campus. The second scenario, Plan B, assumes that approximately 50% of event attendees park off campus, with the remaining 50% of attendees parking on campus.

Traffic operations were evaluated for each of the following scenarios during a typical weekday p.m. peak hour during summer intersession:

- Existing Conditions (2015);
- Existing Plus 2020 OTFT Conditions with Plan A Parking; and
- Existing Plus 2020 OTFT Conditions with Plan B Parking.

2. TRAFFIC OPERATIONS METHODOLOGY

The quality of traffic operations is characterized using the concept of level of service (LOS). Level of service is defined by a range of grades from A (best) to F (worst). At intersections, LOS "A" represents relatively free operating conditions with little or no delay. LOS "F" is characterized by extremely unstable flow conditions and severe congestion with volumes at or near the intersection's design capacity. This results in long queues backing up from all approaches to intersections.

In this report, analysis of traffic operations was conducted according to the Los Angeles County traffic impact analysis guidelines. Utilizing these guidelines, intersection operating conditions were quantified using the Intersection Capacity Utilization (ICU) method. Volume-to-capacity (V/C) ratios and corresponding levels of service (LOS) were calculated at study intersections during the weekday a.m. and p.m. peak hours most closely matching the construction time periods. LOS analyses for all study intersections were conducted using TRAFFIX software. **Table 1** presents a brief description of each level of service letter grade, as well as the range of V/C ratios associated with each grade for signalized intersections.

TABLE 1: INTERSECTION LEVEL OF SERVICE DEFINITIONS – ICU METHODOLOGY

| Level of Service | Description | Intersection Volume to Capacity (V/C) Ratio |
|------------------|---|---|
| A | Excellent operation. All approaches to the intersection appear quite open, turning movements are easily made, and nearly all drivers find freedom of operation. | 0.000-0.600 |
| B | Very good operation. Many drivers begin to feel somewhat restricted within platoons of vehicles. This represents stable flow. An approach to an intersection may occasionally be fully utilized and traffic queues start to form. | >0.600-0.700 |
| C | Good operation. Occasionally drivers may have to wait more than 60 seconds, and back-ups may develop behind turning vehicles. Most drivers feel somewhat restricted. | >0.700-0.800 |
| D | Fair operation. Cars are sometimes required to wait more than 60 seconds during short peaks. There are no long-standing traffic queues. | >0.800-0.900 |
| E | Poor operation. Some long-standing vehicular queues develop on critical approaches to intersections. Delays may be up to several minutes. | >0.900-1.000 |
| F | Forced flow. Represents jammed conditions. Backups form locations downstream or on the cross street may restrict or prevent movement of vehicles out of the intersection approach lanes; therefore, volumes carried are not predictable. Potential for stop and go type traffic flow. | > 1.000 |

For intersections operated under Caltrans' jurisdiction, analysis of traffic operations were conducted utilizing the Highway Capacity Manual (HCM) methodology for evaluation of intersection operating conditions. **Table 2** presents a brief description of each level of service letter grade, as well as the range of HCM average intersection delay associated with each grade for signalized intersections.

TABLE 2: INTERSECTION LEVEL OF SERVICE DEFINITIONS – HCM METHODOLOGY

| Level of Service | Description | Signalized Intersection Delay (seconds per vehicle) |
|------------------|---|---|
| A | Excellent operation. All approaches to the intersection appear quite open, turning movements are easily made, and nearly all drivers find freedom of operation. | ≤ 10 |
| B | Very good operation. Many drivers begin to feel somewhat restricted within platoons of vehicles. This represents stable flow. An approach to an intersection may occasionally be fully utilized and traffic queues start to form. | $>10 \text{ and } \leq 20$ |
| C | Good operation. Occasionally drivers may have to wait more than 60 seconds, and back-ups may develop behind turning vehicles. Most drivers feel somewhat restricted. | $>20 \text{ and } \leq 35$ |
| D | Fair operation. Cars are sometimes required to wait more than 60 seconds during short peaks. There are no long-standing traffic queues. | $>35 \text{ and } \leq 55$ |
| E | Poor operation. Some long-standing vehicular queues develop on critical approaches to intersections. Delays may be up to several minutes. | $>55 \text{ and } \leq 80$ |
| F | Forced flow. Represents jammed conditions. Backups form locations downstream or on the cross street may restrict or prevent movement of vehicles out of the intersection approach lanes; therefore, volumes carried are not predictable. Potential for stop and go type traffic flow. | > 80 |

This analysis conservatively utilizes the Los Angeles County Public Works traffic impact review guidelines, which state that a project's traffic impact is evaluated based on ICU and is considered significant if the change in volume to capacity ratio (V/C) relative to the "without project" signalized intersection level of service (LOS) meets or exceeds the thresholds contained in **Table 3**. These guidelines are more stringent than the Los Angeles County Metropolitan Transportation Authority (LACMTA) guidelines which were used in the 2008 traffic impact analysis for the Mt. SAC Master Plan Update EIR.

TABLE 3: INTERSECTION SIGNIFICANT IMPACT CRITERIA

| Intersection LOS in Pre-Project Conditions | V/C | Project V/C Increase |
|--|--------------|----------------------|
| C | 0.71 to 0.80 | 0.04 or more |
| D | 0.81 to 0.90 | 0.02 or more |
| E / F | 0.91 or more | 0.01 or more |

In addition, a project impact is considered significant to a Caltrans facility if the project traffic results in a worsening level of service from LOS D or better to LOS E or F. In addition, a project impact is considered significant if a Caltrans facility is currently operating at LOS E or F and the project traffic results in an increase in average vehicle delay.

3. EXISTING CONDITIONS

This section presents the existing conditions of the study area. Existing intersection traffic counts were collected on October 1, 2015 during the p.m. peak period (4:00 – 6:00 p.m.) on a typical weekday. Thus, this analysis is considered conservative since existing traffic counts were collected during the fall session, whereas the OTFT is anticipated to occur during the summer intersession where less students are on campus. **Figure 2** shows the existing traffic volumes at the study intersections. Existing traffic count data is provided in **Appendix A**.

A level of service analysis was conducted to evaluate existing intersection operations during the p.m. peak hour at the nineteen study intersections. **Table 4** summarizes the existing LOS at the study intersections. LOS calculations sheets are provided in **Appendix B**.

Notes:

V/C = Volume to Capacity Ratio, LOS = Level of Service.

As shown in **Table 4**, the following study intersections are currently operating at LOS E or worse during the p.m. peak hour:

- Grand Avenue/La Puente Road; and
- Grand Avenue/Valley Boulevard.

4. OLYMPIC TRACK AND FIELD TRIALS TRAFFIC

The OTFT event is planned to occur during the month of June, coinciding with Mt. SAC's summer intersession. This section summarizes the methodology used to derive the p.m. peak hour traffic related to the OTFT full capacity event during a weekday, with an anticipated 20,000 attendees. Two OTFT traffic/parking scenarios are assessed in this report. The first scenario, Plan A, assumes that approximately 30% of the event attendees park off campus at remote parking lots and hotels, and take shuttles to and from the stadium. The shuttles would also provide service to Ontario International Airport. The other 70% of attendees would park on campus. The second scenario, Plan B, assumes that approximately 50% of event attendees park off campus, with the remaining 50% of attendees parking on campus.

Table 5 presents the Preliminary Event Schedule.

As shown in **Table 5**, traffic related to the OTFT event would result in p.m. peak period conflicts within the area for only four weekdays.

As part of the OTFT event, shuttle service would be provided to several off-site locations. **Table 6** summarizes the estimated schedule for the shuttle service.

Off-campus Parking Plan A Traffic

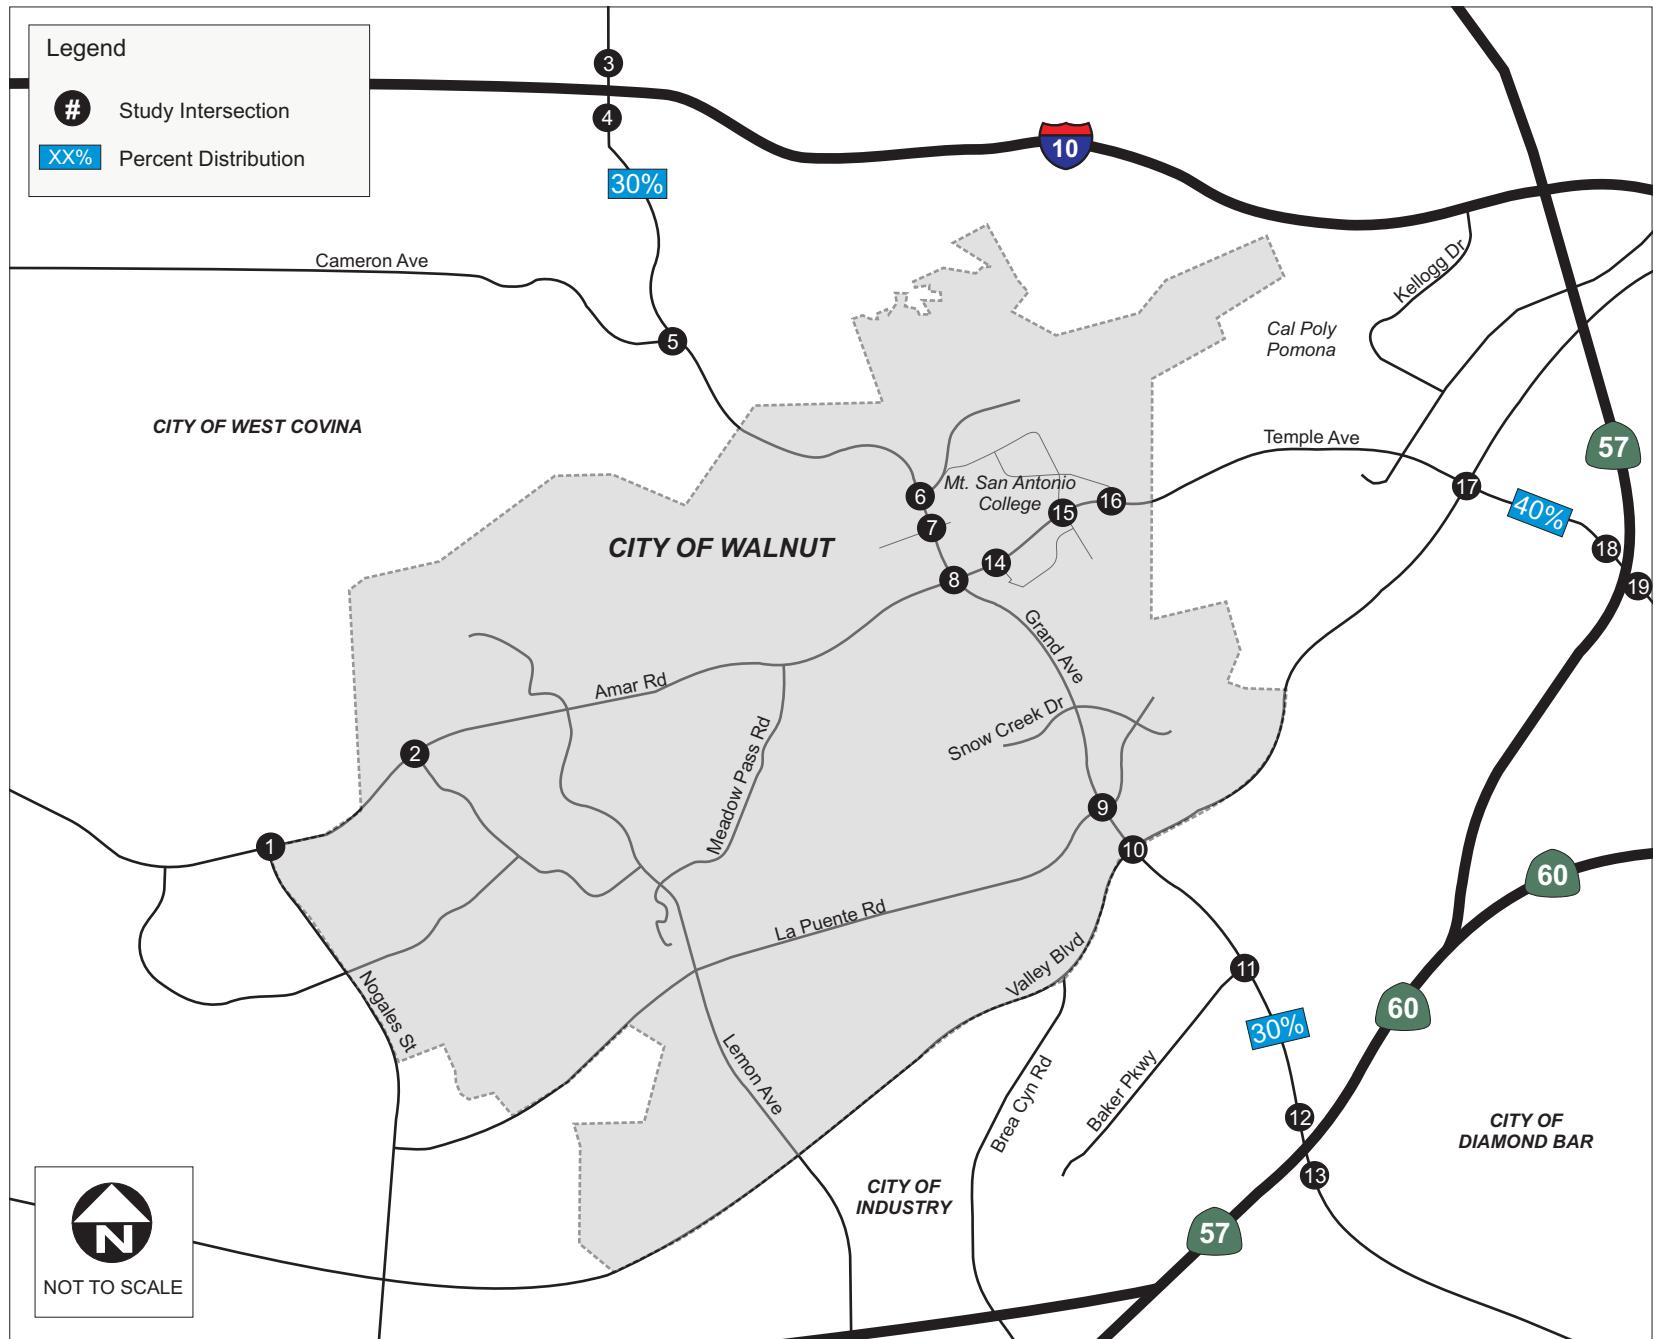

Parking per Plan A assumes the use of up to six on-campus lots and utilizes an average vehicle occupancy of 3.0 persons/vehicle in order to estimate the number of guests per lot. **Figure 4** shows the estimated parking demand at campus lots during the OTFT event with Plan A condition. In addition to on-campus lots, off-campus parking facilities at Cal Poly Pomona and Lanterman Development Center are anticipated to be utilized. **Table 8** summarizes the parking demand and total guests at each of the on-campus and off-campus parking facilities in Plan A.

Off-campus Parking Plan B Traffic

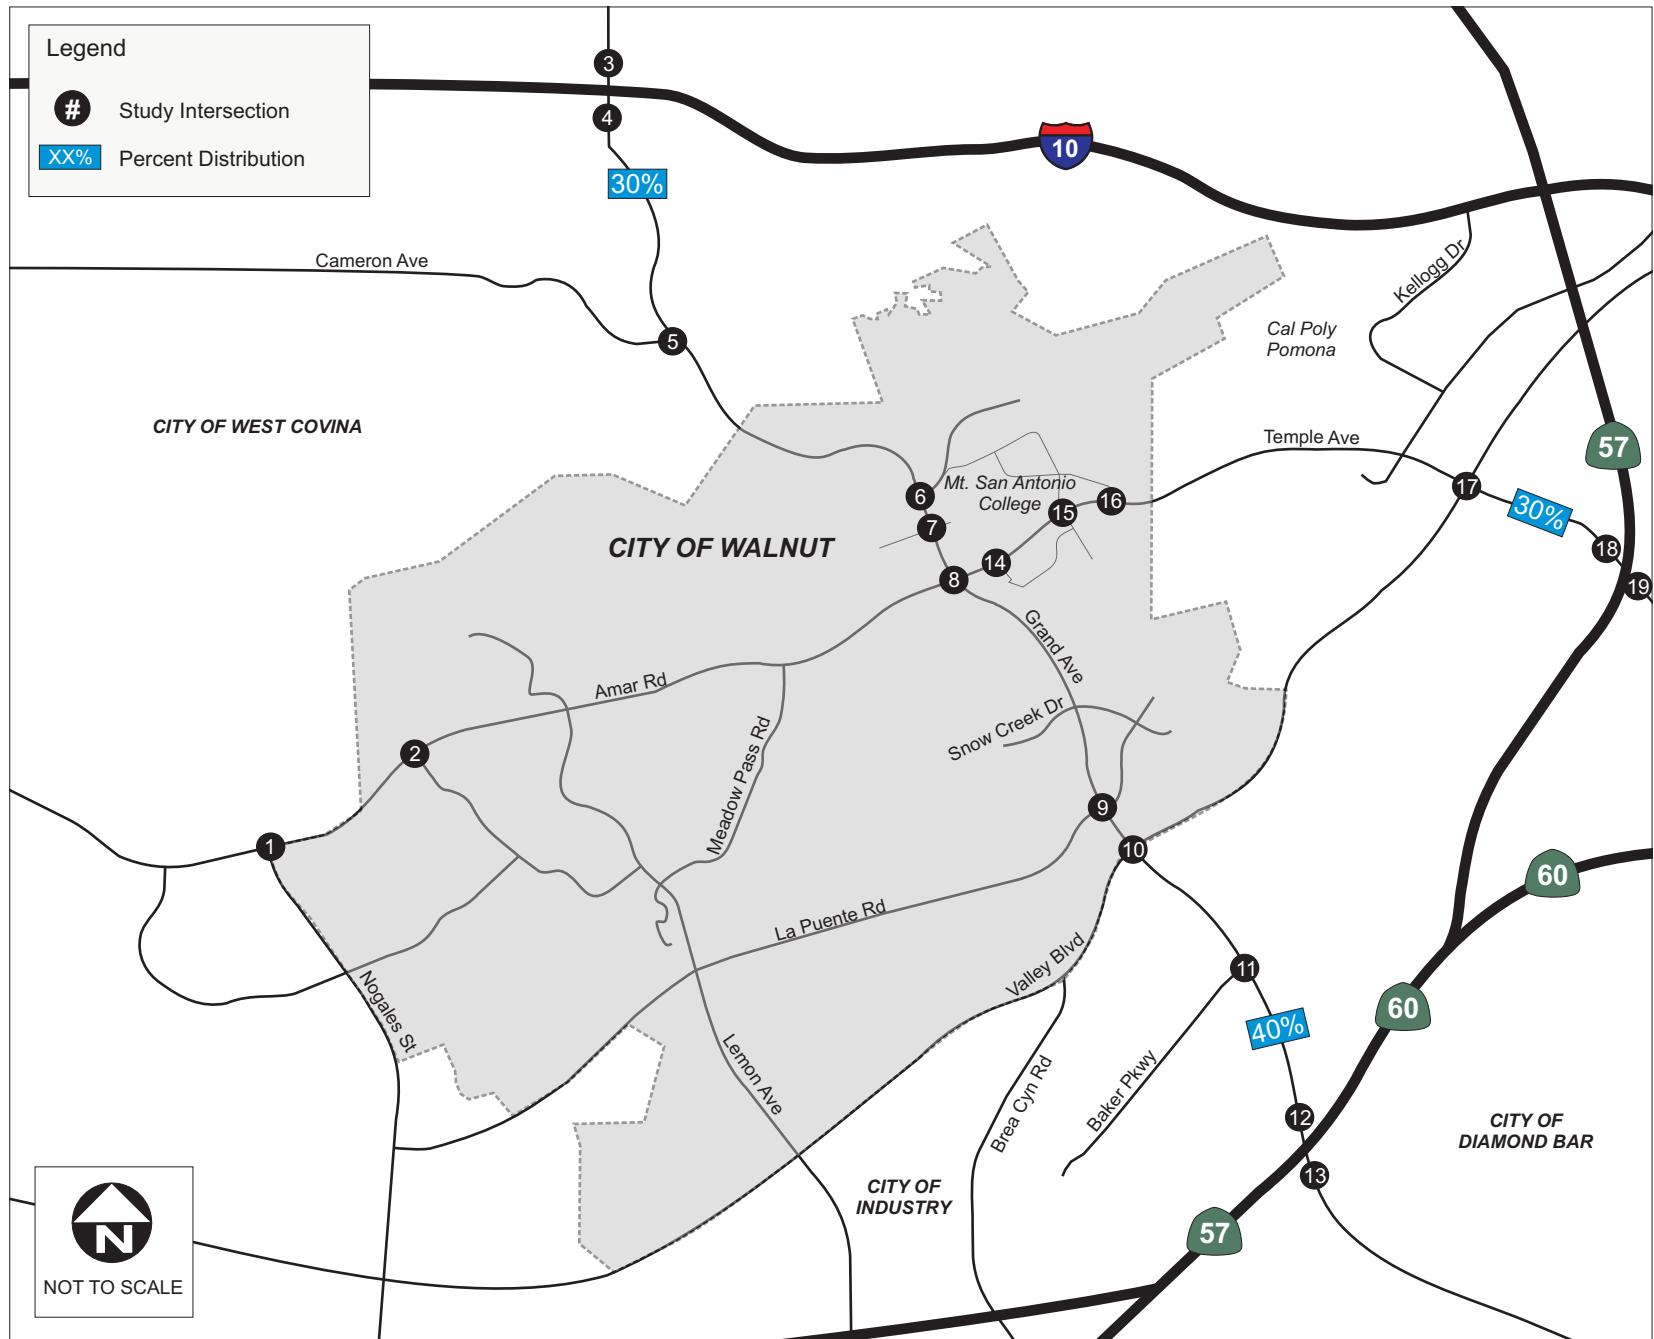

Parking per Plan B assumes the use of up to two on-campus lots and utilizes an average vehicle occupancy of 3.0 persons/vehicle in order to estimate the number of guests per lot. **Figure 7** shows the estimated parking demand at campus lots during the OTFT event with Plan B condition. In addition to on-campus lots, off-campus parking facilities at Cal Poly Pomona and local high schools are anticipated to be utilized. **Table 9** summarizes the parking demand and total guests at each of the on-campus and off-campus parking facilities in Plan B.

Notes:

V/C = Volume to Capacity Ratio, LOS = Level of Service.

As shown in **Table 10**, based on the thresholds of significance described in Section 2, all but five intersections are forecast to be significantly impacted by the proposed OTFT project Plan A traffic during the weekday p.m. peak hour. Since these impacts would only occur during the p.m. peak hour on four weekdays, it is not recommended that physical mitigation measures be implemented to mitigate these temporary impacts.

* Caltrans intersection, utilizing HCM delay-based methodology to evaluate intersection operations.

Notes:

V/C = Volume to Capacity Ratio, LOS = Level of Service.

As shown in **Table 11**, based on the thresholds of significance described in Section 2, all but six intersections are forecast to be significantly impacted by the proposed OTFT project Plan B traffic during the weekday p.m. peak hour. Since these impacts would only occur during the p.m. peak hour on four weekdays, it is not recommended that physical mitigation measures be implemented to mitigate these temporary impacts.

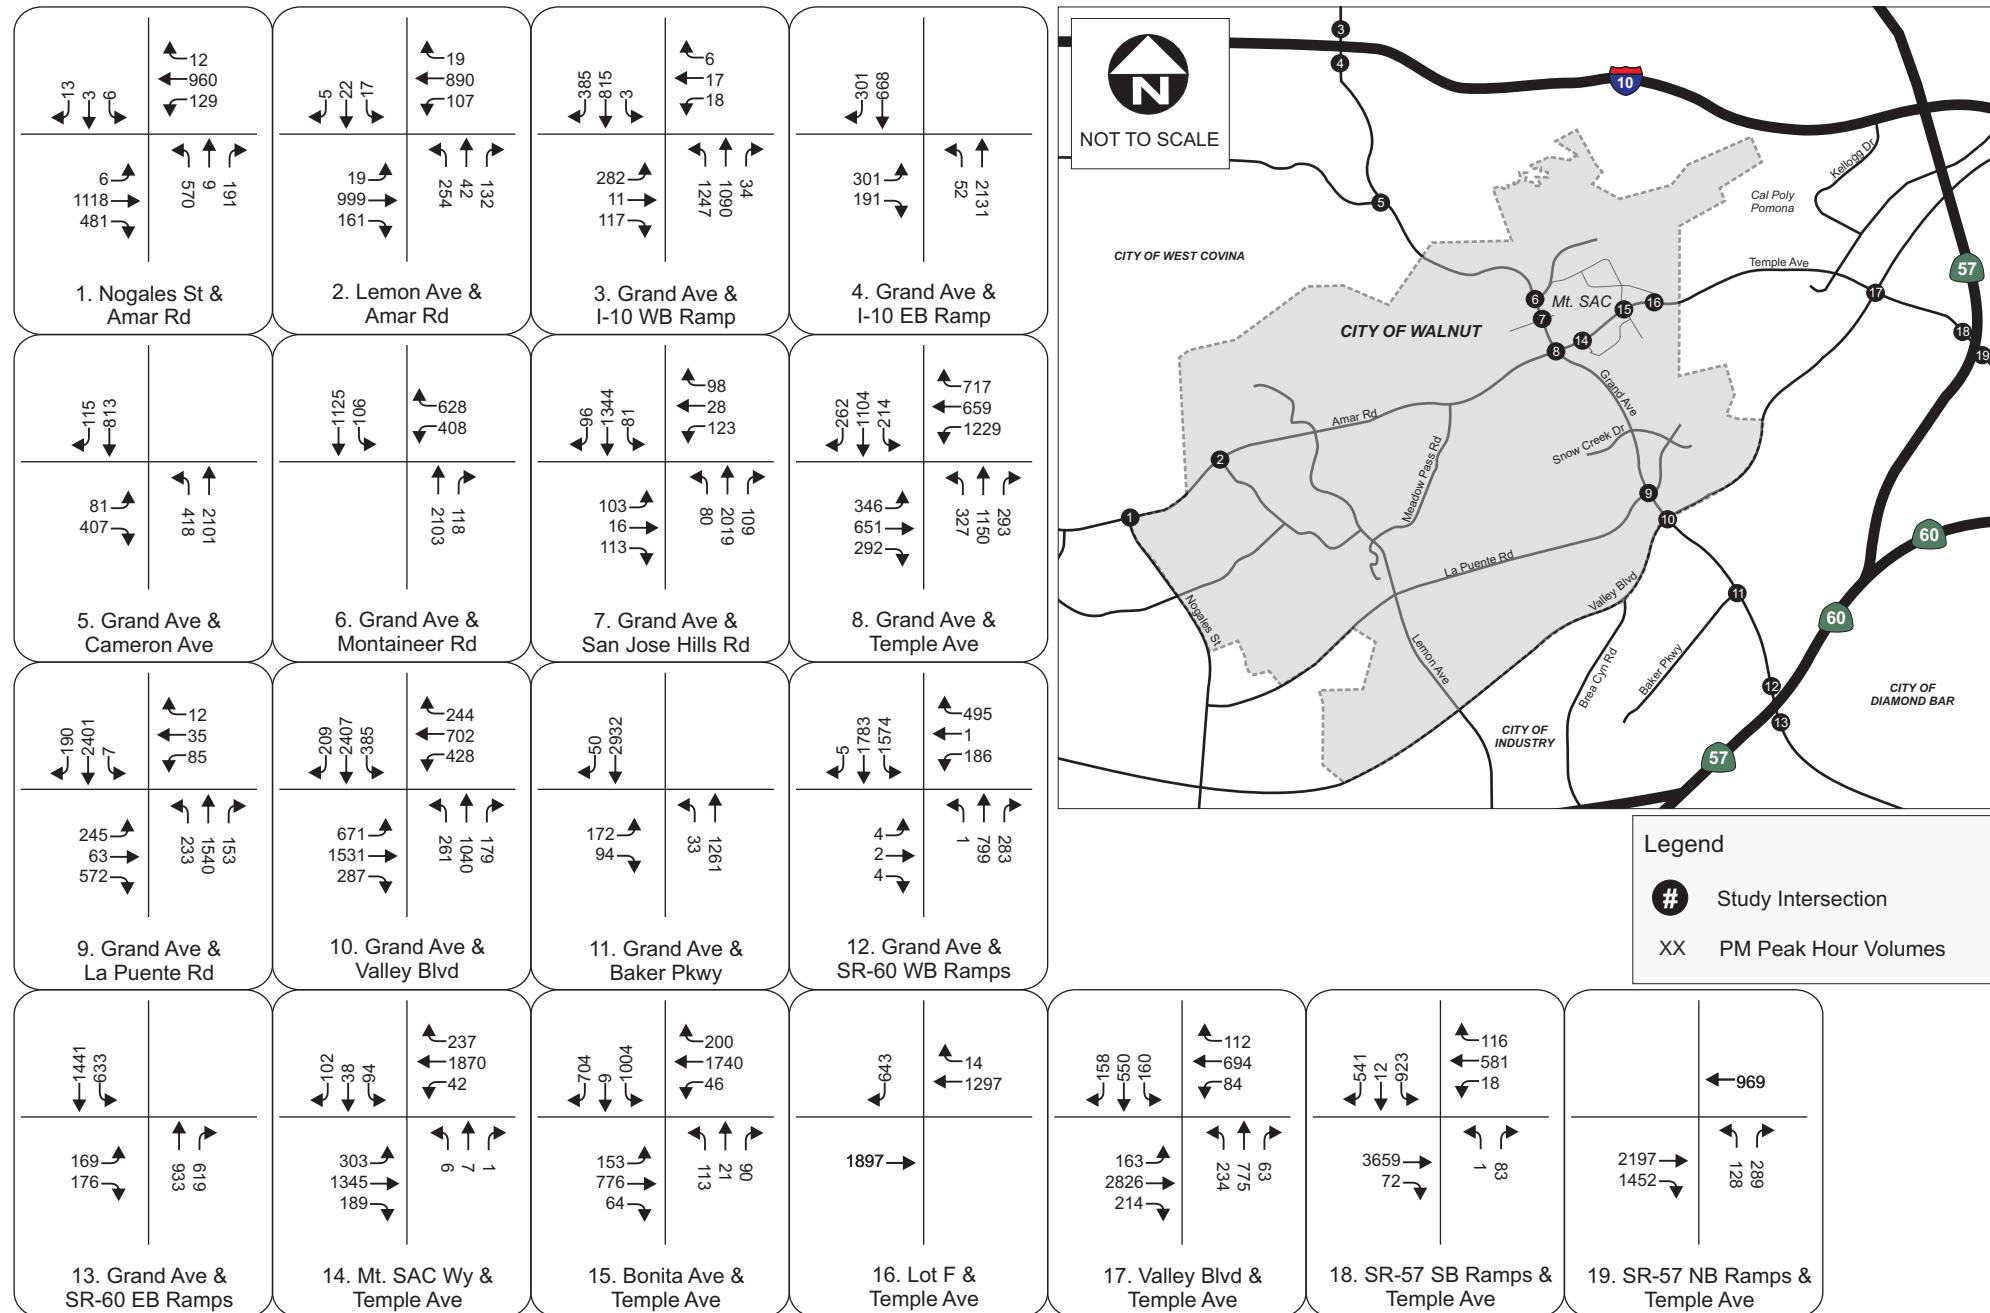

FIGURE 11
Existing Plus OTFT Plan B

Though physical mitigation is not recommended, in order to reduce the p.m. peak period conflicts between area commuter traffic and 2020 OTFT traffic leaving the final event on Friday or Monday during Session 1, the event schedule shall be revised so guest traffic leaves before the p.m. peak commute period begins or after the p.m. peak commute period ends. Either event schedule revision will result in reducing the number of p.m. peak period conflicts by two days, and only two of the ten event days during Session 2 have p.m. peak conflicts. Facilities Planning and Management shall ensure compliance.

7. CONGESTION MANAGEMENT PROGRAM (CMP) ANALYSIS

The Congestion Management Program (CMP) was created statewide as a result of Proposition 111 and has been implemented locally by the Los Angeles County Metropolitan Transportation Authority (Metro). The CMP for Los Angeles County requires that the traffic impact of individual development projects of potential regional significance be analyzed. A specific system of arterial roadways plus all freeways comprise the CMP system. A total of 164 intersections are identified for monitoring on the system in Los Angeles County. This section describes the analysis of project-related impacts on the CMP system. The analysis has been conducted according to the guidelines set forth in the 2004 Congestion Management Program for Los Angeles County.

According to the CMP Traffic Impact Analysis (TIA) Guidelines developed by Metro, a CMP traffic impact analysis is required given the following conditions:

- CMP arterial monitoring intersections, including freeway on- or off-ramps, where the proposed project would add 50 or more trips during either the a.m. or p.m. weekday peak hours.
- CMP freeway monitoring locations where the proposed project would add 150 or more trips, in either direction, during either the a.m. or p.m. weekday peak hours.

The nearest freeway segments are the I-10, SR-60, and SR-57. Based on the project trip generation estimates, the proposed project has the potential to add more than 150 new peak hour trips in either direction at the freeway segments.

The freeway segments are analyzed based on the volume-to-capacity ratio (V/C) methodology. For purposes of the CMP, substantial changes for freeway segments are defined as an increase of 0.10 in V/C ratio and a corresponding change in LOS.

Table 12 summarizes the CMP freeway segment analysis for the Plan A parking condition.

As shown in **Table 12**, the OTFT traffic with Plan A is forecast to result in significant CMP impacts at three of the affected freeway segments during the p.m. peak hour. However, it should be noted that these impacts would only occur during the p.m. peak hour on four weekdays.

Table 13 summarizes the CMP freeway segment analysis for the Plan B parking condition.

As shown in **Table 13**, the OTFT traffic with Plan B is forecast to result in significant CMP impacts at two of the affected freeway segments during the p.m. peak hour. However, it should be noted that these impacts would only occur during the p.m. peak hour on four weekdays.

8. CONCLUSIONS

The OTFT event is planned to occur during the month of June, coinciding with Mt. SAC's summer intersession. The weekday p.m. peak hour is analyzed as part of this report, representing the worst-case time period when the last OTFT event of the day would conclude.

All study intersections, with the exception of the Grand Avenue/Valley Boulevard and Grand Avenue/La Puente Road intersections, are currently operating at LOS D or better during the p.m. peak period.

Parking per Plan A assumes the use of up to six on-campus lots and is anticipated to utilize off-campus parking facilities at Cal Poly Pomona and Lanterman Development Center. Parking per Plan B assumes the use of up to two on-campus lots and is anticipated to utilize off-campus parking facilities at Cal Poly Pomona and local high schools.

Based on the thresholds of significance described in Section 2, all but five intersections are forecast to be significantly impacted by the proposed OTFT project Plan A traffic during the weekday p.m. peak hour. All but six intersections are forecast to be significantly impacted by the proposed OTFT project Plan B traffic during the weekday p.m. peak hour.

The OTFT traffic with Plan A is forecast to result in significant CMP freeway impacts at three of the affected freeway segments during the p.m. peak hour. The OTFT traffic with Plan B is forecast to result in significant CMP freeway impacts at two of the affected freeway segments during the p.m. peak hour. However, it should be noted that these impacts would only occur during the p.m. peak hour on four weekdays. Since these impacts would only occur during the p.m. peak hour on four weekdays, it is not recommended that physical mitigation measures be implemented to mitigate these temporary impacts.

Though physical mitigation is not recommended, in order to reduce the p.m. peak period conflicts between area commuter traffic and 2020 OTFT traffic leaving the final event on Friday or Monday during Session 1, the event schedule shall be revised so guest traffic leaves before the p.m. peak commute period begins or after the p.m. peak commute period ends. Either event schedule revision will result in reducing the number of p.m. peak period conflicts by two days, and only two of the ten event days during Session 2 have p.m. peak conflicts. Facilities Planning and Management shall ensure compliance.
