with support from

Western Interstate Commission for Higher Education

The Western Interstate Commission for Higher Education (WICHE) is a federal compact of the 15 Western states and U.S. Pacific Territories and Freely Associated States established to promote and facilitate resource sharing, collaboration, and cooperative planning. WICHE's mission is to expand educational access and excellence for all citizens of the West. Members are:

Alaska	Montana	Utah
Arizona	Nevada	Washington
California	New Mexico	Wyoming
Colorado	North Dakota	U.S. Pacific Territories and Freely Associated States
Hawai'i	Oregon	
Idaho	South Dakota	

WICHE's broad objectives are to:

- Strengthen educational opportunities for students through expanded access to programs.
- Assist policymakers in dealing with higher education and human resource issues through research and analysis.
- Foster cooperative planning, especially that which targets the sharing of resources.

This publication was prepared by the Policy Analysis and Research Unit, which is involved in the research, analysis, and reporting of information on public policy issues of concern in the WICHE states. Inquiries regarding these data should be directed to Peace Bransberger, senior research analyst, at pbransberger@wiche.edu or 303.541.0257. To download a copy of this report and access related data resources, please visit www.wiche.edu/knocking. Additional WICHE resources are available at www.wiche.edu.

FOREWORD

As a former community college and university president, as well as the former executive director of the Colorado Department of Higher Education, I have spent a lot of time thinking about how best to serve Colorado residents and their need for high-quality, postsecondary programs. Some of our state colleges and universities had excess capacity while others turned away scores of applicants every year. Students from some demographic populations seemed to enroll and graduate at high rates, while others were consistently underrepresented in our institutions. As I worked to ensure that our institutions were meeting our short-term needs, it was easy to overlook the important planning that was necessary to create the capacity to serve not just the students who were already at our doors, but those who would be coming next year, five years, and 10 years in the future. That is why I relied on the critically important information provided in the *Knocking at the College Door* reports that have been produced by the Western Interstate Commission for Higher Education (WICHE) for the last four decades.

This latest report, like the ones before it, provides an important predictive analysis of future high school graduates, including not just the anticipated number of graduates but also the demographic composition of those graduates and the geographic areas in which we will see growth, stagnation, or decline. The data tell us that even when the number of graduates does not change dramatically, the same cannot be

said of the racial and ethnic composition of those graduating classes. Nor are there consistent patterns in the geographic areas that produce those graduates. Regions, states, and communities reflect very different growth rates, and similarly, we see very different growth rates among our racial and ethnic demographic populations, with the strongest growth rates among Asians and Hispanics. With the right planning and focus, people from all demographic populations can help us meet the workforce challenges all states will face in the future as a result of our changing economy.

Because every state has limited resources for K-12 and higher education, and because every state faces a need for a more educated workforce, we must ensure that we are targeting our resources effectively. This report will help all of us, as it helped me in my previous roles, to do exactly that. We can meet the education and workforce needs of the future, but only if we know whom we must serve effectively in our postsecondary institutions. New student populations may require new approaches and new techniques – from the time, place, and manner of instructional delivery to the non-instructional support systems that improve enrollment and outcomes. This edition of *Knocking at the College Door*, like all those that preceded it, provides a roadmap to help guide us through the demographic changes that will define our future.

Joseph A. Garcia
President

Western Interstate Commission for Higher Education

ACKNOWLEDGEMENTS

WICHE is grateful to the many colleagues and organizations who contributed to the production of the 9th edition of *Knocking at the College Door: Projections of High School Graduates*. In particular, WICHE would like to acknowledge the financial support and partnership of ACT, Inc. and The College Board, for without their collaboration and guidance this report and related resources would not have been possible. WICHE also thanks members of the *Knocking at the College Door* Advisory Group for their wise counsel and advice over the past year. Members include:

Patricia Barth, director, Center for Public Education,
National School Boards Association (NSBA)

Jack Buckley, senior vice president, research, The
College Board

Emily Calderon Galdeano, senior associate, Excelencia
in Education

Andrew Carlson, senior policy analyst, State Higher
Education Executive Officers (SHEEO)

Matthew Crellin, senior associate, National Center for
Higher Education Management Systems (NCHEMS)

Will Doyle, associate professor, Vanderbilt
University

Nate Easley, executive director, Denver Scholarship
Foundation

Steve Kappler, vice president, brand experience,
ACT, Inc.

Jeffrey Passel, senior demographer, Pew Research
Center

Kent Rinehart, assistant vice president of enrollment
management/dean of admission, Marist College

José Rios, director, multicultural communications,
The College Board

David Sanders, research director, American Indian
College Fund

Brian Sponsler, director, postsecondary institute,
Education Commission of the States (ECS)

Jeff Strohl, director of research, Georgetown Center
on Education and the Workforce

Christina Whitfield, associate vice president, State
Higher Education Executive Officers (SHEEO)

Several individuals were instrumental to the production and dissemination of this report. Colleen Falkenstern, WICHE's intern in the Policy Analysis and Research unit, assisted with data collection and analysis, and Candy Allen, WICHE's senior graphic designer, provided her support, talent, and patience throughout the entire process. Paul Lagasse of Active Voice Editorial Consulting edited the print publication, while Boulder Insight developed the online data visualization tool, and Bross Group designed the *Knocking at the College Door* website. Finally, we want to thank Christina Sedney, Patrick Lane, Sarah Ohle Leibrandt, and Jere Mock for their review of the projections, contributions along the way, and copyediting of everything we asked them to review. This has truly been a group effort, and we appreciate all the hard work and dedication of everyone involved.

EXECUTIVE SUMMARY

For nearly 40 years, the Western Interstate Commission for Higher Education (WICHE) has produced projections of high school graduates. The purpose of *Knocking at the College Door: Projections of High School Graduates* is to equip decision-makers at all levels with information about how the numbers of high school graduates are likely to change in the years ahead. These projections inform a broad audience; stakeholders including policymakers, elected officials and their staffs, state departments of education and higher education, postsecondary system heads, K-12 and school district leaders, administrators at public and private colleges and universities, researchers, policy organization staff, media, and others rely on them for a broad variety of uses.

This 9th edition of *Knocking at the College Door* spans school years 2000-01 through 2031-32. As in previous editions, it examines data on public and private schools and projects the number of high school graduates for the nation, four geographic regions, the 50 states, and the District of Columbia. And, for the first time, WICHE also includes projections for Guam and Puerto Rico. Finally, *Knocking* also presents projections for public high school graduates, disaggregated by race/ethnicity.

U.S. High School Graduating Classes Have Reached a Plateau

After steady increases in the overall number of high school graduates over the last 15 years, the U.S. is headed into a period of stagnation. WICHE's projections indicate that the number of graduates in each graduating class will average around 3.4 million through 2023, before peaking at 3.56 million prior to 2026. At the same time, the number of high school graduates from private religious and nonsectarian schools is projected to decline.

Key points include:

- ▶ The nation is projected to produce fewer high school graduates in all of the 10 graduating classes between 2014 and 2023, compared to the highest recorded number of graduates in 2013. The year of greatest decline is projected to be 2017, with about 81,000 fewer graduates (2.3 percent). Three years of growth are projected for 2024 to 2026, reaching about 94,000 more graduates in 2025 (2.7 percent) than in 2013. Between 2027 and 2032, the average size of graduating classes is expected to be smaller than those in 2013.
- ▶ The number of high school graduates from private religious and nonsectarian schools is projected to decline at an even greater rate than the overall trend, from 302,000 in 2011 (the last year for which confirmed graduate counts are available for private schools) to about 220,000 by the early 2030s – a decrease of 80,000 graduates, or 26 percent. Furthermore, graduates from private schools will represent a gradually smaller share of the total by the end of the projection period, from 10 percent of all graduates nationally in 2000 to 9 percent in 2010 to 7 percent by the early 2030s.

Swift Change in the Racial/Ethnic Composition of Public High School Graduates

The pending national plateau is largely fueled by a decline in the White student population and counterbalanced by growth in the number of non-White public school graduates – Hispanics and Asian/Pacific Islanders in particular. Overall, there will be consistent declines in the number of White public high school graduates and robust growth in the number of public high school graduates of color (or, technically speaking, "non-White" graduates) in the coming years.

Visit www.wiche.edu/knocking to access data, individual state profiles, presentations, and copies of the report.

Key points include:

- ▶ **White public high school graduates.** By 2030, the number of White public school graduates is projected to decrease by 14 percent compared to 2013. Even in 2024-26, when the nation is projected to see some overall increase in the number of high school graduates, there will be about 110,000 fewer White public high school graduates than there were in 2013. The pace of the decline in the number of White public high school graduates is projected to further accelerate after 2025. By 2032, the number of White public high school graduates is projected to be 1.6 million, which is about 252,000 fewer than in 2013. Between the first (2013-14) and last (2031-32) projected years, the share of total high school graduates represented by White high school graduates is projected to drop six percentage points, and over the three decades between the first historical year (2000-01) and the last projected year (2031-32) included in this edition, that share is projected to drop 19 percent.
- ▶ **Non-White public high school graduates.** Between 2018 and 2028, growth in the number of non-White public high school graduates is projected to replace the numerical decrease in White graduates to a varying extent. In the first five of those years, between 2018 and 2023, the projected increase in the number of non-White public high school graduates could replace the decline in the number of White high school graduates (public and private combined) almost one-to-one. In the years of rapid increase in the number of non-White public high school graduates from 2024 to 2028 – when non-White public high school graduates are projected to number between 1.5 and 1.6 million – for every 100 White high school graduates "lost," there will be an increase of 150 non-White high school graduates. However, in the last years of the projections (2029 to 2032), the number of non-White high school graduates will then fall back to below 1.5 million, which is about the same level as 2020 but still 12 percent higher than in 2013 – an effect of the overall decline in birth rates that began after 2007.
- ▶ **Hispanic public high school graduates.** The number of Hispanic high school graduates is projected to increase by 50 percent or more from the first projected year, 2014, to the high point of 920,000 graduates around 2025.
- ▶ **Asian/Pacific Islander public high school graduates.** About 58,000 more Asian/Pacific Islander public high graduates are expected by the early 2030s compared with 2013, representing an increase of up to 30 percent.
- ▶ **Native Hawai'ian/Pacific Islander public high school graduates.** Although it was not possible to produce reliable projections for Native Hawai'ian/Pacific Islander public high school graduates, the data indicate that between 2010-11 and 2013-14, Hawai'ian/Pacific Islanders represented about 7 percent of the total combined number of Asian/Pacific Islander students, or about 10,000 public high school graduates on average in these years.
- ▶ **Black public high school graduates.** The number of Black public high school graduates recently reached a high of about 480,000 in 2010 through 2012. But between now and the early 2030s, the number of Black, non-Hispanic public high school graduates is projected to gradually decline by about 6 percent.
- ▶ **American Indian/Alaska Native public high school graduates.** American Indian/Alaska Native public high school graduates represent only about 1 percent of the total number of public high school graduates currently, or about 32,000 graduates annually in recent years. This group is projected to decline in number in every year of the projections, to about 25,000 by 2025 and 23,000 by the early 2030s, at which point it will make up only about 0.7 percent of all public high school graduates.
- ▶ **Two or More Races public high school graduates.** It was not possible to produce reliable projections from the available data for public high school graduates of Two or More Races. The data, however, indicate that students of Two or More Races represented 1 to 3 percent of all non-Hispanic public high school students in the years between 2010-11 and 2013-14.

Regional Variation

The national projections of the total number of public and private high school graduates mask significant variations among the nation's four geographic regions. In general, two overriding patterns have been identified among the four regions throughout the years projected: growth in the number of high school graduates in the South and West, and continuing declines in the number of high school graduates in the Midwest and Northeast. Key points include:

- ▶ **The South.** The South is the only region that is projected to experience an increase in the number of high school graduates for every year of the projections, although that number is expected to contract after 2025. In the early 2000s, about one-third (33 percent) of the nation's high school graduates were located in the South, and the region's share of the national total grew to 43 percent, or 1.23 million high school graduates, by 2013. During the few years of high growth that are expected to end around 2025, it is projected that Southern states will generate almost 47 percent of the nation's high school graduates, or 1.35 million graduates. By that point, it is projected that the number of graduates in the region will be about 10 percent more than the 2012-13 figure. After this high point, the South is projected to produce about 45 percent of the nation's high school graduates through the end of the projection period – an annual average of 1.25 million high school graduates.
- ▶ **The West.** The West generated 25 percent of the nation's high school graduates in the early 2000s. By 2010, high school graduates from the West represented about 29 percent of the national total (813,400 graduates); that number is projected to be about 30 percent of the total throughout the projection period. The West is projected to reach its new high point in 2024 with about 860,000 high school graduates. It will remain the second-highest-producing region behind the South during the course of the projections, although it is expected to drop back slightly to 28 percent of the total (about 784,000 graduates) by the early 2030s.
- ▶ **The Midwest.** In 2013, the Midwest generated 22 percent of the nation's high school graduates (about 762,000). That share is projected to decrease to 19 percent by 2030, meaning 93,000 fewer high school graduates by that time (a decline of 12 percentage points compared to 2013).
- ▶ **The Northeast.** The trend is broadly the same for the Northeast, which produced around 639,000 graduates in 2013, or 18 percent of the national total. By 2030, the number of high school graduates in the Northeast is projected to decrease to around 567,000 graduates. This number will represent 72,000 fewer graduates by 2030 (a decline of 11 percentage points compared to 2013), and will lead to the Northeast contributing only 16 percent of the nation's high school graduates by the early 2030s.

First-Time Projections for U.S. Pacific Territories and Freely Associated States

For the first time, WICHE attempted projections for Guam and Puerto Rico (data limitations prevented WICHE from making projections for the Commonwealth of the Northern Mariana Islands). Key points include:

- ▶ **Guam.** Projections indicate that Guam will continue to steadily produce an average of 1,500 public high school graduates per year through the Class of 2023, after which it appears there will be an uptick in high school graduates to about 1,800 on average, per year, related to growth in the number of births from 2006 to 2012 and solid enrollment progression.
- ▶ **Puerto Rico.** Puerto Rico public schools produced between 29,000 and 32,000 high school graduates in the years between 2000-01 and 2008-09. Declines in births and enrollments begins to show at the high school level most notably beginning in 2009-10, and continuing in each subsequent year. The projections indicate that the Class of 2020 public high school graduates will fall below 20,000. And that by the Class of 2028, there will be less than half the number of public high school graduates as 20 years prior, below 15,000.

Trends with Younger Youth Drive High School Graduate Production

WICHE relies on data about the number of recent births and recent K-12 enrollment counts to generate the high school graduate projections in *Knocking at the College Door*. While these births and enrollment data are not the focus of this publication, WICHE does generate K-12 enrollment projections and makes them available because they provide useful information about the young children who will ultimately move through the educational pipeline and emerge as high school graduates over the course of the next 15 years or so. Key points include:

- ▶ **White public school students.** The greatest declines are among the numbers of White public school students, whose enrollments declined 8 percent (from 26.3 million to 24.2 million) between 2000-01 and 2010-11, and are projected to decline another 7 percent (to 22.4 million) by 2020-21. White students comprised 54 percent of total public school enrollments in the 2010-11 school year, and 56 percent of middle and high school enrollments, respectively. By school year 2020-21, White students are projected to represent just 50 percent of public school enrollments overall, and this number is projected to dip below 50 percent in the middle and high school grades by school year 2028-29, the last year of WICHE's high school enrollment projections.
- ▶ **Hispanic public school students.** Data show just how substantial the contribution of Hispanic students was to public school enrollments overall between 2000 and 2010, increasing from 6.8 million in 2000-01 to 10.1 million in 2020-21 – an increase from 16 percent to 23 percent of all public school students. By grade level, the number of Hispanic public elementary school students increased by 39 percent, 49 percent at the middle school level, and 68 percent at the high school level. The number of Hispanic middle and high school students is projected to continue increasing at a swift pace, by 29 percent and 35 percent, respectively, between 2010-11 and 2020-21. However, the previous rates of increase do not appear to be sustained at the elementary school level, at which the number of Hispanic elementary school students is projected to increase by only 1 percent through 2020-21. Past 2020-21, trends in the number of Hispanic public high school students will follow the overall trend downward. By school year 2020-21, Hispanic students are projected to account for 26 percent of all public school first- through fifth-graders. Also by school year 2020-21 and going forward throughout the projections, Hispanic students are projected to account for 26 to 28 percent of all public middle school and high school students.
- ▶ **Black public school students.** The total number of Black public school students is expected to remain relatively steady compared with the other student populations. The number of Black public elementary school students is projected to decline by 3 percent from 3.01 million in 2010-11 to around 2.93 million by 2020-21. The number of Black public middle school students will increase by 2 percent from 1.82 million in 2010-11 to 1.86 million students by 2020-21, and then decline by about 7 percent, to about 1.74 million students, by 2025-26. The number of Black public high school students is projected to decline by 7 percent from 2.47 million in 2010-11 to 2.31 million by 2020-21, and then decline another 2 percent by 2028-29. Between 2000-01 and 2010-11, the number of Black public high school students declined by a percentage point among total enrollments, in part due to small numerical declines but primarily as a result of the strong increase in the number of Hispanic students. By 2010-11, Black public high school students comprised 16 percent of public school elementary and middle school enrollments and 17 percent of public high school enrollments. The percentage of Black students enrolled in public high school is expected to remain at or very near this number throughout the course of the projections.
- ▶ **Asian/Pacific Islander public school students.** Asian/Pacific Islander public school students are the only student population that is projected to consistently add K-12 public school enrollments throughout the projections, at all school levels. Between 2010-11 and 2020-21, Asian/Pacific Islander public school elementary enrollments are projected to increase by 7 percent (an increase

of about 308,000 students), middle school students by 12 percent (155,000), and high school students by 11 percent (224,000). Even in the later years of the projections, when all other student populations are expected to decline in number, the number of Asian/Pacific Islander students is expected to increase. The projections show there will be an additional 7 percent of Asian/Pacific Islander middle school students between 2020-21 and 2025-26, and 10 percent more Asian/Pacific Islander public high school students between 2020-21 and 2028-29. The total number of Asian/Pacific Islander public high school students is projected to increase past 1 million by 2028-29.

- ▶ **Native Hawaiʻian/Pacific Islander public school students.** Due to data limitations, WICHE was unable to produce reliable projections for Native Hawaiʻian/Pacific Islander public high school students. The available data, however, indicate that between 2010-11 and 2013-14, Hawaiʻian/Pacific Islanders represented about 7 percent of the total combined number of Asian/Pacific Islander students at each school level – elementary, middle, and high school (the number of Native Hawaiʻian/Pacific Islander public school students decreased about 2 percent between school year 2012-13 and 2013-14, which is somewhat contrary to the expected trend).
- ▶ **American Indian/Alaska Native public school students.** American Indian/Alaska Native students make up roughly 1 percent of all public school students at all levels. Overall, the number of American Indian/Alaska Native students is projected to decrease over the course of the projections. The number of American Indian/Alaska Native public elementary school students is projected to decline by 14 percent between 2010-11 and 2020-21, from about 215,000 to about 184,500 students. At the middle school level, the number is projected to decline by 13 percent by 2020-21 and another 11 percent by 2025-26, from about 131,000 students in 2010-11 to 101,500 students by 2025-26. The number of American Indian/Alaska Native public high school students is projected to decline by 28 percent (from about 175,000 to about 125,000 students) between 2010-11 and 2028-29.

- ▶ **Two or More Races public school students.** Due to data limitations, WICHE was not able to produce reliable projections for public school students in the Two or More Races category. Students of Two or More Races represented 3 percent of non-Hispanic students in the first through fifth grades in 2010-11, and 5 percent by 2013-14, a 33 percent increase over these four years. In 2013-14, they represented 4 percent of non-Hispanic sixth to eighth graders, and 3 percent of high school students. Nationally, the number of reported students increased by 10 percent or more each year between 2010-11 and 2013-14. These are unusually high rates of growth, which make the accuracy of extrapolated results questionable.
- ▶ **Private school students.** The number of private school students dipped below 10 percent of total high school enrollments by 2010-11, and this population is projected to decline in both number and share throughout the projection period – ultimately down to 6 to 8 percent of total enrollments across school levels in the later years of the projections. The declines are projected to be steepest over the next few years, and then should level off somewhat. The number of private elementary and middle school students is projected to decrease 9 percent and 14 percent, respectively, from 2010-11 through 2020-21. Private high school enrollment is expected to decline 22 percent over this period. Private school enrollment at the middle school and high school levels is projected to decline at about the same rate as overall enrollments in the later years of the projections.

Policy Questions and Implications

Many public policy questions and implications arise from an examination of the data in *Knocking at the College Door*, including short- and long-term considerations to be addressed all along the educational pathway, from the K-12 achievement and postsecondary attainment gaps between certain populations of students to related implications for the workforce.

CHAPTER 1. INTRODUCTION

For nearly 40 years, the Western Interstate Commission for Higher Education (WICHE) has produced projections of high school graduates. When WICHE first began publishing projections back in the 1970s, the education landscape looked very different than it does today. In 1979, the same year that President Jimmy Carter signed the law that established the U.S. Department of Education, there were 3,042,000 high school graduates; in 2013, that number had risen to 3,467,000, a 12 percent increase (see Figure 1.1).¹ Whether this trend will continue is an issue that is discussed at length in this publication.

Not only are there more graduates today, but they are also more likely to graduate. In 1979, the average high school graduation rate was 71.9 percent;² in 2014, that rate hit a record high of 82 percent.³ To be fair, one cannot accurately compare today’s graduation rates to those from four decades ago, because in years past, states did not use uniform graduation rates. In fact, it was not until 2010-11 that all 50 states began using a common measure. Despite some challenges caused by inconsistent and incomplete data over the years, most observers agree that the nation’s high school graduation rates have increased over time, and that is important progress.

The racial and ethnic composition of the nation’s high school graduating classes has become more diverse over time as well. The number of Hispanic students, in particular, has grown with respect to the share of enrollment in public elementary and secondary schools from 13.5 percent in 1995 to 25.8 percent in 2014.⁴ And, while some progress has been made to close the achievement gaps between students of color and White students that have been prevalent since the 1970s, disparities remain.⁵ In 2014, high school graduation rates were at 87 percent for White students, but only 73 percent and 76 percent for Black and Hispanic students, respectively.⁶ And, despite the Supreme Court ruling over 60 years ago that banned segregation in schools, a recent Government Accountability Office report found that it still persists.⁷ In fact, between 2000-01 and 2013-14, the percentage of all K-12 public schools that had high percentages of Black or Hispanic students grew from 9 to 16 percent.⁸ Furthermore, between 75 to 100 percent of the students in those high-minority schools were Black and Hispanic and eligible for free or reduced-price lunches.⁹

Source: William J. Hussar and Tabitha M. Bailey. “Projections of Education Statistics to 2024: Forty-Third Edition.”

At the same time, research shows the importance of obtaining an education in order to keep up with the changing global economy. Data from the Georgetown Center on Education and the Workforce projects that, nationwide, 65 percent of all jobs will require postsecondary training beyond high school by 2020.¹⁰ So, although much has changed over the last 40 years, there is still more work to be done to create and maintain a more equitable education system that will serve an evolving population.

The purpose of *Knocking at the College Door* is to equip decision-makers at all levels with information about how the numbers of high school graduates are likely to change in the years ahead. These projections inform a broad audience; stakeholders including policymakers, elected officials and their staffs, state departments of education and higher education, postsecondary system heads, K-12 and school district leaders, administrators at public and private colleges and universities, researchers, policy organization staff, media, and others rely on them for a broad variety of uses. Now more than ever, these key stakeholders expect reliable data to be available to inform their decisions. Information, evaluation, and accountability are now part of education conversations, policy, and practice at all levels, and WICHE will continue to contribute to these important decisions by producing reliable projections of high school graduates through the *Knocking at the College Door* series of products for years to come.

For *Knocking at the College Door* to be as useful as possible and for the data to be used appropriately, it is important to understand the basic methodological approach to these projections (Appendix C provides detailed technical information and a description of the methodology). This 9th edition of *Knocking at the College Door* spans school years 2000-01 through 2031-32. As in previous editions, it examines data on

public and private schools and projects the number of high school graduates for the nation, four geographic regions, the 50 states, and the District of Columbia. For the first time, WICHE is also providing projections for Guam and Puerto Rico. And, finally *Knocking* also includes projections for public high school graduates that have been disaggregated by race/ethnicity.

WICHE relies on data from the National Center for Education Statistics' (NCES) Common Core of Data (CCD) for public school data. The Private School Universe Survey (PSS), a biannual survey conducted in odd years by NCES that provides data for religious and nonsectarian private/nonpublic elementary and secondary schools in all 50 states and the District of Columbia, is WICHE's source for private school data.

WICHE produces its projections using the cohort survival ratio (CSR) method, which observes the progression of individuals from birth to first grade, through the grades each year, and from the 12th grade to graduation. WICHE uses these ratios, which have been calculated from all available data, to project the number of enrollments and graduates in each of the subsequent years. WICHE uses a five-year smoothed average ratio when making its projections, which places relatively greater weight on the most recent year's data without eliminating any trends that would be evident by taking a longer view. It is important to note that the results are not graduation rates, and while there is an implied rate of progression in this methodology, there is not a set cohort.

At the time of publication, the most recent available CCD data were for enrollments through school year 2013-14 and graduates through 2012-13. WICHE analyzed select state data to determine whether the lack of more recent data would significantly impact its projections. Based on available information, WICHE determined that this data lag would not meaningfully

Visit www.wiche.edu/knocking to access data, individual state profiles, presentations, and copies of the report.

impact its projections (refer to Appendix C for a detailed summary of the process that WICHE used to make this determination).

In addition to the basic methodology, there are several cautions that must be understood when interpreting and applying these projections. First, *Knocking at the College Door* exclusively projects the numbers of high school graduates and by extension, high school enrollments (as discussed in Chapter 4). While many stakeholders who rely on these projections use them to forecast future demand for postsecondary enrollment, the projections encompass only those students who are in the traditional educational pipeline. With the number of adult students enrolling in postsecondary education often fluctuating based on the performance of the U.S. economy, these projections provide an important but limited view of the general characteristics of the students who will be entering the nation's colleges and universities over the next 15 years.

Second, WICHE considered whether it was possible to make projections in the seven expanded race/ethnicity categorizations, which are now the required convention in most federal data sources. After exploring options and consulting several experts, WICHE ultimately determined that it was impossible to make reliable projections in the expanded race/ethnicity categories primarily because the data on reported births and school enrollments using these new categories remain insufficient. Therefore, in this edition, WICHE provides projections by the historical racial/ethnic categories (see Appendix C for a detailed discussion). The reported actual counts of students in the additional race/ethnicity categories are published in Appendix A for informational purposes.

Finally, as with any set of projections, the longer into the future one looks, the more possibility there is for the projected numbers to deviate from future actual numbers. Furthermore, there may be less numerical precision for smaller states and smaller subgroups. That being said, WICHE's projections of U.S. total public high school graduates from the 2003, 2008, and 2012 editions of *Knocking* have been determined to be, on average, within 2 to 3 percent of the actual graduate numbers subsequently reported for the first four years of projections. Appendix C describes in

detail WICHE's efforts to analyze the historical accuracy of past projections.

The 9th edition of *Knocking at the College Door* will show that the context of K-12 education is continuing to evolve. The latest projections once again reflect the continual change that the nation has been experiencing over the last 40 years. This edition takes a deep dive into the national projections in Chapter 2, and Chapter 3 examines regional variation and changes at the state level. Once again, *Knocking at the College Door* highlights projections by race/ethnicity in the public schools. Chapter 4 focuses on current high school enrollments and projections. This edition also includes an exploration and discussion of policy implications, which is featured in Chapter 5.

Just as societal changes over the last 40 years have resulted in better student academic outcomes overall and even some improvement within specific racial/ethnic groups, the demographic changes that are projected for the future will reveal similar untapped potential and new visions. It is up to policymakers, practitioners, academics, and other stakeholders in K-12 and higher education to chart the path forward and decide how to take advantage of the opportunities before them.

CHAPTER 2. NATIONAL PROJECTIONS

The 9th edition of *Knocking at the College Door* provides national projections of and describes overall changes in the numbers of high school graduates in years to come. This perspective gives a bird's eye view of what the changing demographics will look like in terms of both public and private high school graduates and by race/ethnicity (in public schools only).

U.S. High School Graduating Classes Have Reached a Plateau

After 15 years of steady increases – from 2.52 million in 1996 to 3.47 million in 2013 (the latest year that confirmed graduate counts are available) – it appears that the annual number of U.S. high school graduates will level out at around 3.4 to 3.5 million (see Figure 2.1).¹ WICHE’s projections indicate that the number of graduates per year will average around 3.4 million through 2023, before peaking at 3.56 million prior to 2026. This peak, fueled by an increase in the number of non-White high school graduates, represents a 3 percent increase over the previous high of 3.47 million graduates in 2013 (see Appendix A for U.S., regional, and state high school graduate data tables).

Beyond 2026 or so, the number of high school graduates will decline as the fewer number of children born during the Great Recession and the subsequent recovery enter high school through the early 2030s. The number of high school graduates is projected to drop 9 percent between 2026 and 2031, to 3.25 million. And, as of the release date of these projections, there is no indication of a sustained upward trend in births to suggest a sudden increase in high school graduates after 2032.

In fact, the nation is projected to produce fewer high school graduates in all of the 10 years between 2013 and 2023, compared to the highest recorded number of graduates in 2013. The year of greatest decline is projected to be 2017, with about 81,000 fewer graduates (2.3 percent). Three years of growth are projected for 2024 to 2026, reaching about 94,000 more graduates in 2025 (2.7 percent) than in 2013. Between 2027 and 2032, the average size of graduating classes is expected to be smaller than those in 2013.

Figure 2.1. Total U.S. Public and Private High School Graduates, School Years 2000-01 to 2012-13 (Actual) through 2013-14 to 2031-32 (Projected)

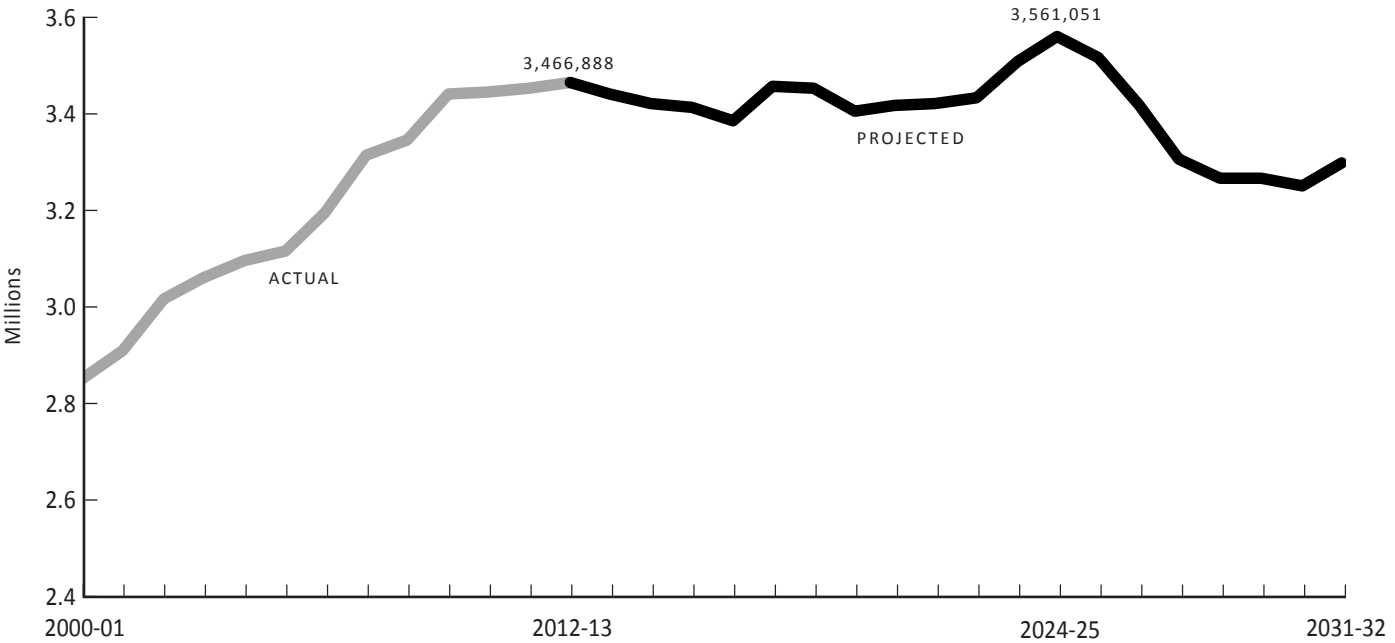

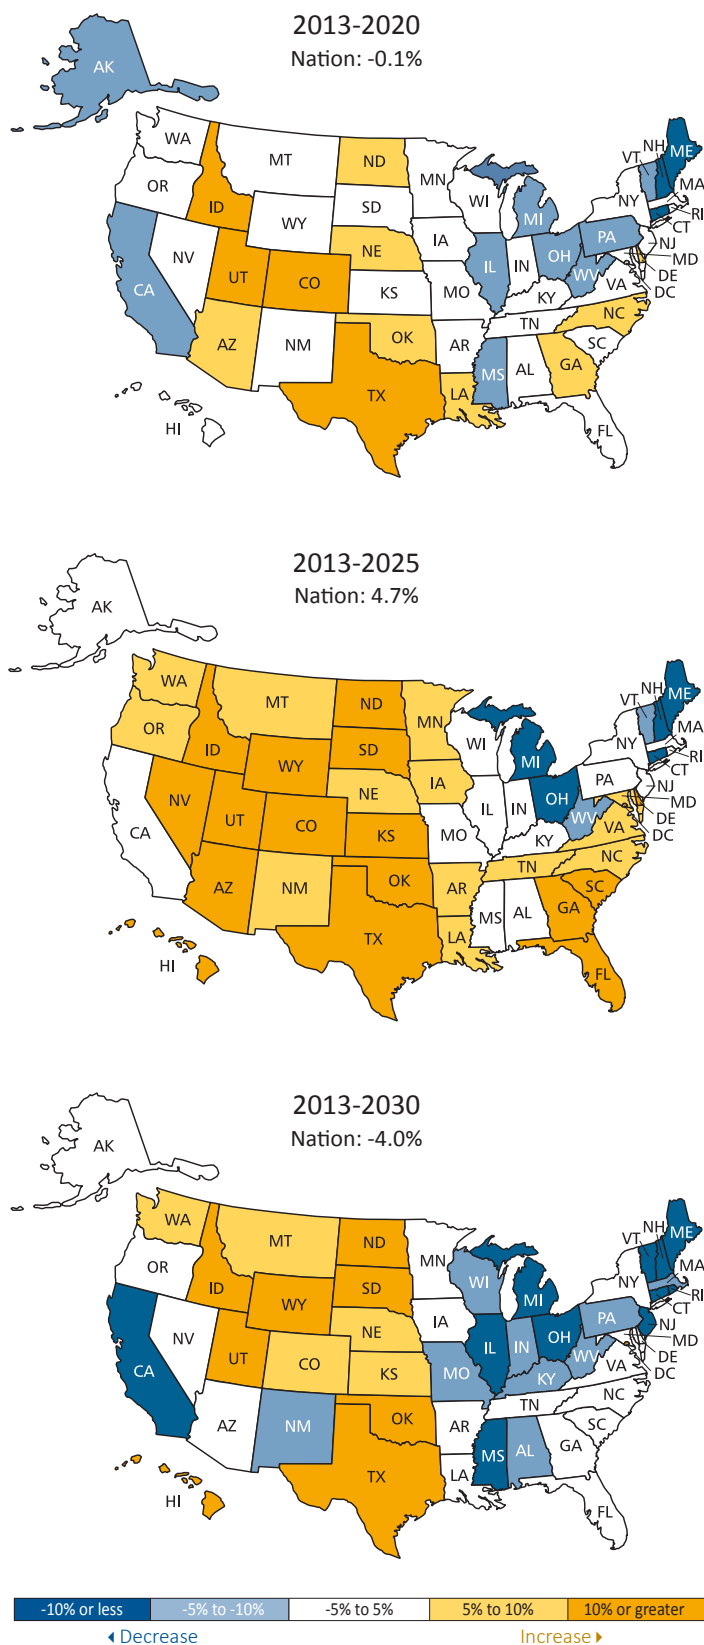

Figure 2.2. U.S. High School Graduating Classes, Percent Change from 2013 (Public Total)

To provide a snapshot of the percentage change from 2013 in typical planning timeframes, the maps in Figure 2.2 show the graduating classes of 2020, 2025, and 2030 compared to 2013 (for public schools total only).

By comparing the public high school graduating classes in approximately five-, 10-, and 15-year ranges, several findings emerge:

- ▶ By 2020 – less than five years from now – the number of public high school graduates nationally is projected to be about 3,000 fewer than in 2013 (a decline of 0.1 percent). In almost half of the states the number of graduates is projected to stay the same or even increase. The slight national decrease is due to the large projected decline (3 percent) in California, which has a large percentage of high school students in the overall population, as well as to deep declines in the number of high school students in states in the Midwest and Northeast. Meanwhile, the number of students in many states in the South and West will be stable or even increase significantly during this timeframe.
- ▶ By 2025 – about 10 years from now – the overall number of public high school graduates is expected to increase moderately, culminating in a projected new high of 3.37 million graduates. This growth is reflected in the map for 2025, in which most of the states show growth except, once again, for California and some of the states in the Northeast and Midwest.
- ▶ By 2030 – about 15 years from now – the annual number of public high school graduates is expected to decline by about 120,000 compared with 2013 (a 4 percent decrease). This is primarily a result of the decline in birth rates. California alone is projected to produce 12 percent fewer graduates (about 52,000) than it had roughly 15 years earlier. Virtually all the Midwest and Northeast states will continue to experience declines in the number of graduates, with a number of these states seeing graduating classes 15 to 25 percent smaller than just 15 years earlier. On the other hand, the sizes of graduating classes in Texas and several Midwestern states, and many of the Western states, are projected

to continue increasing, thereby mitigating the overall trend toward a decline in the number of graduates. The number of graduates in many of the Southern states will be relatively stable during this timeframe, while other states in the region will experience declines.

Private Schools Continue Losing Share

When considering projections of the number of high school graduates, it is important to distinguish between public and private schools. Specifically, it is important to note that public high school graduates (as opposed to those who graduate from private schools) currently comprise 91 percent of the total number of high school graduates in the nation, and therefore, drive the projection trends.²

The number of high school graduates from private religious and nonsectarian schools is projected to decline at an even greater rate than the overall trend, from 302,000 in 2011 (the last year for which confirmed graduate counts are available for private schools) to about 220,000 by the early 2030s – a decrease of 80,000 graduates, or 26 percent (see Figure 2.3). Furthermore, graduates from private schools will represent a gradually smaller share of the total by the end of the projection period, from 10 percent of all graduates nationally in 2000 to 9

percent in 2010 to 7 percent by the early 2030s. The decline in private school student enrollments is driven by declines in students at religious schools of all affiliations, but underpinned by large declines in the number of Catholic school students, which represents the longstanding majority of private school students. The National Center for Education Statistics (NCES) reports that the number of students enrolled in nonsectarian schools decreased somewhat between 2005-06 and 2011-12, but has rebounded and remains about the same as it was in the early 2000s.³

Swift Change in the Racial/Ethnic Composition of Public High School Graduates

Understanding the full picture of WICHE's high school graduate projections involves an exploration of trends by race/ethnicity. Due to data limitations, however, projections by race/ethnicity are limited to public high school graduates. As mentioned above, public high school graduates (as opposed to those who graduate from private schools) currently comprise 91 percent of the total number of high school graduates, and therefore provide a reasonably comprehensive representation of the racial/ethnic composition of future high school graduating classes. Overall, there will be consistent declines in the number of White public high school graduates and robust growth of

Figure 2.3. U.S. Private High School Graduates, School Years 2000-01 to 2010-11 (Actual) through 2011-12 to 2031-32 (Projected)

public high school graduates of color (or, technically speaking, "non-White" graduates) in the coming years.⁴ Figure 2.4 illustrates these trends in the composition of graduating classes in U.S. high schools from 2001 to 2032 by race/ethnicity, including magnitude of change.

White High School Graduates in Decline

White students have long been the determinant force driving high school graduate trends. Barely a decade and a half ago, Whites represented 70 percent of all high school graduates (69 percent of public high school graduates, plus approximately 76 percent of private high school graduates).⁵ A long-predicted decline in the number of White public high school graduates began in 2007, and by 2030 the number of White public school graduates is projected to decrease by 14 percent compared to 2013 (see Figure 2.5). Even between 2024 and 2026, when the nation is projected to see some overall increase in the number of high school graduates, there will be about 110,000 fewer White public high school graduates than there were in 2013. The pace of the decline in the number of White public high school graduates is projected to further accelerate after 2025. By 2032, the number of White public high school graduates is projected to be 1.6 million, which is about 252,000 fewer than in 2013. As a result of these consistent declines and

the concomitant growth in the number of non-White students, by the early 2030s, White high school graduates are projected to comprise 53 percent of high school graduates (52 percent of public high school graduates and 71 percent of private high school graduates).⁶

Between the first (2013-14) and last (2031-32) projected years, the share of total high school graduates represented by White high school graduates is projected to drop six percentage points, and over the three decades between the first historical year (2000-01) and the last projected year (2031-32) included in this edition, that share is projected to drop 19 percent. With the share of White public high school graduates projected to hover around 52 percent in the last projected years, or 53 percent when including White private high school graduates, the racial/ethnic makeup of the nation's high school graduating classes is nearing the tipping point between majority and minority. Unforeseen increases in the number of non-White high school graduates could tip the balance within the span of these projections.

Growth Comes from Non-White Public Graduates

Robust growth in the number of non-White public school graduates – Hispanics and Asian/Pacific

Figure 2.4. Total U.S. Public and Private High School Graduates, by Race/Ethnicity, School Years 2000-01 to 2012-13 (Actual) through 2013-14 to 2031-32 (Projected)

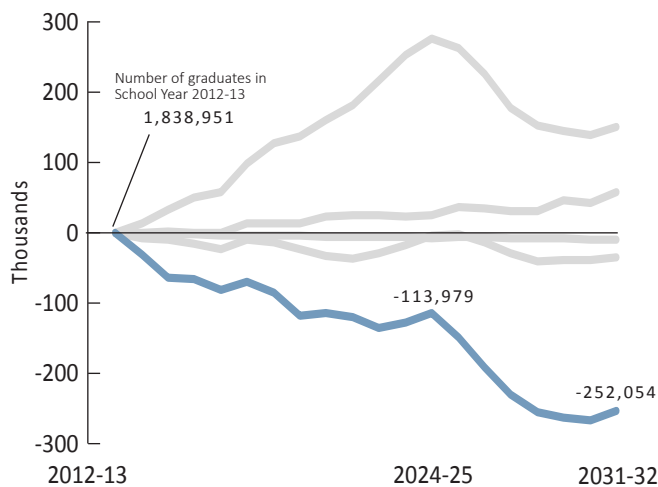

Figure 2.5. Projected Cumulative Change in U.S. High School Graduates after School Year 2012-13, by Race/Ethnicity (White)

Islanders in particular – will act as a counterbalance to the declining numbers of White graduates, even though they are starting from a substantially smaller numerical base compared to Whites (1.33 million and 1.84 million, respectively, in 2013) and as a result will not mitigate the overall flattening of growth driven by the decreases in the number of Whites. In the years between 2018 and 2028, growth in the number of non-White public high school graduates is projected to replace the numerical decrease in White graduates to a varying extent. In the first five of those years, between 2018 and 2023, the projected increase in the number of non-White public high school graduates could replace the decline in the number of White high school graduates (public and private combined) almost one-to-one. In the years of rapid increase in the number of non-White public high school graduates from 2024 to 2028 – when non-White public high school graduates are projected to number between 1.5 and 1.6 million – for every 100 White high school graduates "lost," there will be an increase of 150 non-White high school graduates. However, in the last years of the projections (2029 to 2032), the number of non-White high school graduates will then fall back to below 1.5 million, which is about the same level as 2020 but still 12 percent higher than in 2013 – an effect of the overall decline in birth rates that began after 2007.

Greater Numbers of Graduates in the Short Term Than Previously Projected

Overall, current data reflecting the number of high school graduates are 2 to 5 percent higher for the 2009-12 school years than what the 8th edition of *Knocking at the College Door* projected in 2012.⁷ This is due in large part to much stronger growth and retention in the high school grades after 2010-11, and in some part to slightly greater graduation rates from 12th grade, than was previously indicated in the data. Much of this difference is accounted for by the states that contribute the greatest numbers of students to the national total and that have large Hispanic high school populations, California and Texas in particular – although the unpredictably strong number of graduates is not limited to Hispanic graduates. In fact, it was reasonable to expect that the conversion to counting students as Hispanic over other races, as required for all federal data, would have provided a boost to the number of Hispanic graduates, and it appears that it consistently has. However, the significant increase in the number of Hispanic graduates between 2010 and 2013, which represents a large part of the overall higher number of graduates who were not previously predicted at their actual levels, appear to be real increases.

While it was impossible to confirm the precise reasons for this strong growth, background research suggests it may have to some extent arisen from Deferred Action for Childhood Arrivals (DACA), a federal immigration policy implemented in 2012 that provides temporary relief from deportation and a two-year work permit to certain individuals who were brought to the U.S. illegally as children.⁸ DACA requires individuals to be currently enrolled in school, have graduated or obtained a certificate of completion from high school, have obtained a general education development (GED) certificate, or be an honorably discharged veteran of the Armed Forces or Coast Guard of the U.S. The implementation of DACA therefore may have increased high school graduation numbers among certain student populations. Other policy changes (e.g., related to students with disabilities or changes in high school exit exam requirements) and any other number of policy innovations may have resulted in higher graduate numbers, not to mention more accurate student tracking through state longitudinal data systems. It is worth noting that notwithstanding the slightly greater number of high school graduates, colleges across the country have been posting enrollment declines that are consistent with the overall slowing of high school graduate production that is underway.⁹

Hispanic public high school graduates. Numerically speaking, Hispanic high school graduates are the primary growth engine. The number of Hispanic high school graduates is projected to increase by 50 percent or more from the first projected year, 2014, to the high point of 920,000 graduates around 2025 (see Figure 2.6). This is an increase of almost 280,000 in the 12 years between 2013 and 2025. The number of Hispanic public high school graduates is then projected to decline from about 900,000 in 2025-26 to 780,000 to 790,000 in the early 2030s, a 14 percent contraction over these five to seven years. This decline is, once again, related to the decline in birth rates described in this report, which was sharpest among Hispanics. The number of Hispanic public high school graduates is not projected to reach 1 million in any of the projected years, but it is not inconceivable that they could reach this milestone in the 15-year span if higher numbers of Hispanic youth make it successfully through the pipeline to high school graduation.

Asian/Pacific Islander public high school graduates.

There is also a steady increase projected for the number of Asian/Pacific Islander public high school graduates. About 58,000 more Asian/Pacific Islander public high school graduates are expected by the early 2030s compared with 2013, representing an increase of up to 30 percent (see Figure 2.7). This represents a relatively smaller increase than the magnitude of growth projected for Hispanic public high school graduates; by the end of the projections, however, Asian/Pacific Islander public high school graduates are the only student population projected to continue to gain, while all other populations are expected to begin declining after the high point around 2025. The number of Asian/Pacific Islander graduates is projected to increase from 185,000 in 2014 to 240,000 in 2032, representing a gain in share of about 2 percent of the total.

Native Hawaiʻian/Pacific Islander public high school graduates. Although it was not possible to produce reliable projections for Native Hawaiʻian/Pacific Islander public high school graduates, the data indicate that between 2010-11 and 2013-14, Hawaiʻian/Pacific Islanders represented about 7 percent of the total combined number of Asian/Pacific Islander students, or about 10,000 public high school graduates

Figure 2.6. Projected Cumulative Change in U.S. High School Graduates after School Year 2012-13, by Race/Ethnicity (Hispanic)

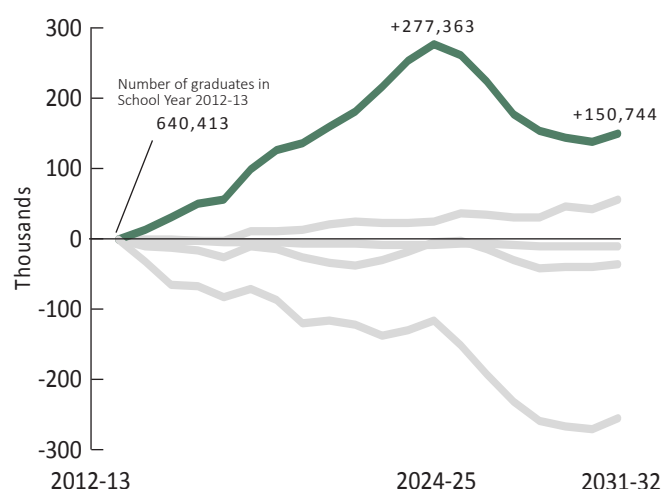

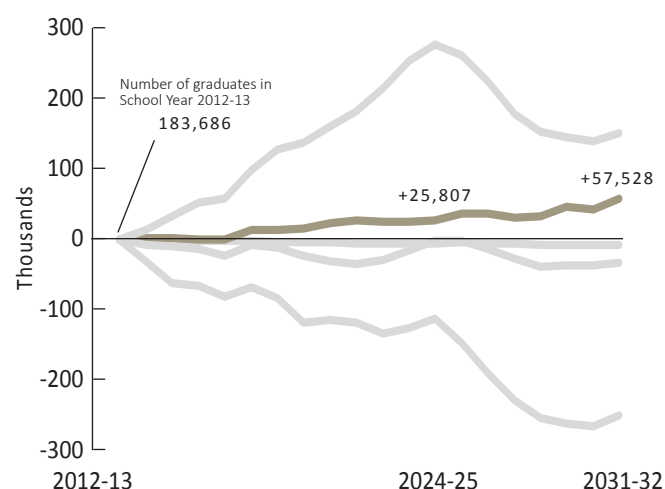

Figure 2.7. Projected Cumulative Change in U.S. High School Graduates after School Year 2012-13, by Race/Ethnicity (Asian/Pacific Islander)

on average in these years.¹⁰ Of course, Hawaiʻian/Pacific Islanders are a substantial part of some states' populations, with education outcomes that are distinct from the overall Asian/Pacific Islander population. Forty percent of Hawaiʻi's Asian/Pacific Islander public high school graduates are Native Hawaiʻian/Pacific Islanders (3,300 graduates on average from 2010-11 to 2012-13). Other states in which Hawaiʻian/Pacific Islanders comprised a notable portion of Asian/Pacific Islander public high school graduates from 2010-11 to 2012-13 include California (4 to 5 percent),

Washington (7 to 8 percent), and Oregon (10 to 12 percent).

Black public high school graduates. The number of Black public high school graduates recently reached a high of about 480,000 in 2010 through 2012. But between now and the early 2030s, the number of Black, non-Hispanic public high school graduates is projected to gradually decline by about 6 percent (see Figure 2.8). This number will vary between 467,000 and 440,000 over the next 15 years. Black graduates are projected to remain about 15 percent of the total number of public high school graduates through 2016, then decline to about 14 percent of the total and remain at that level throughout the remaining years projected.

American Indian/Alaska Native public high school graduates. American Indian/Alaska Native public high school graduates represent only about 1 percent of the total number of public high school graduates currently, or about 32,000 graduates annually in recent years. This population is projected to decline in number in every year of the projections to about 25,000 by 2025 and 23,000 by the early 2030s, at which point it will make up only about 0.7 percent of all public high school graduates (see Figure 2.9).

Two or More Races public high school graduates. It was not possible to produce reliable projections from the available data for public high school graduates of Two or More Races. The data, however, indicate that students of Two or More Races represented 1 to 3 percent of all non-Hispanic public high school students in the years between 2010-11 and 2013-14.

Figure 2.8. Projected Cumulative Change in U.S. High School Graduates after School Year 2012-13, by Race/Ethnicity (Black)

Figure 2.9. Projected Cumulative Change in U.S. High School Graduates after School Year 2012-13, by Race/Ethnicity (American Indian/Alaska Native)

Impact of New Race/Ethnicity Categories in Federal Data

It bears asking whether the declines in Black and American Indian/Alaska Native public high school graduates are a result of stagnation or decline in graduation rates. In fact, these populations have seen growth in graduation rates, which suggests that there would be more, not fewer, graduates.¹¹ The declines in the numbers of Black and American Indian/Alaska Native public high school graduates are more likely the result of the transition to new race/ethnicity categories in federal data. While the race/ethnicity reporting changes affect the relative distribution of individuals between all the categories, Black and American Indian/Alaska Native public school student counts may be particularly susceptible to the effects of the changes, both for racial/ethnicity identity reasons and because of the greater fluctuations that may occur with smaller groups, particularly American Indian/Alaska Natives (among other reasons).¹² Population estimates, for example, indicate that perhaps 10 percent or more of Black individuals may be counted under a different category now compared to previous reporting methods. For more information, please see Appendix C: Technical Information and Methodology.

In the first year that all states reported public high school graduates in this category (2010-11), there were almost 52,000 graduates reported. The number increased to 59,000 graduates in 2011-12, and to 66,000 graduates in 2012-13. The number of reported graduates of Two or More Races increased 27 percent over these three years. It may take several years for these numbers to stabilize enough to allow projections to be computed. Interested readers can find more detail about this topic in the Appendix C: Technical Information and Methodology.

National Projections Summary

After steady increases in the overall number of high school graduates over the last 15 years, the U.S. is headed into a period of stagnation. WICHE's projections indicate that the number of graduates per year will average around 3.44 million through 2023, before peaking at 3.56 million prior to 2026. This trend is largely fueled by a decline in the White population and counterbalanced by growth in the number of non-White public school graduates – Hispanics and Asian/Pacific Islanders in particular. At the same time, the number of high school graduates from private religious and nonsectarian schools is projected to decline at an even greater rate than the overall trend, and graduates from private schools will represent a gradually smaller share of the total by the end of the projection period.

Endnotes

¹ Unless otherwise noted, years for graduates refer to the end of the K-12 school year, e.g., May 1997 of the 1996-97 school year. The latest available data refer to the latest available published data from the National Center for Education Statistics (NCES) Common Core of Data.

² The first projected year is different between public and private school graduates due to differences in data availability. Public school graduates represent 91 percent or more of total graduates, and therefore when this publication refers to the total number of public and private school graduates or to public school graduates alone, it is referring to the first year of projected graduates as the 2013-14 school year, or the Class of 2014. When this publication focuses on private school graduates alone, the first year of projected graduates is for the 2011-12 school year, or the Class of 2012.

³ National Center for Education Statistics, Condition of Education, "Private School Enrollment," May 2016, accessed October 2, 2016, http://nces.ed.gov/programs/coe/indicator_cgc.asp.

⁴ Federally reported data, including the education and births data included in the *Knocking* projections, is classified under a common scheme such that Hispanics include any individuals with Hispanic origins, regardless of their race. And all race categories are non-Hispanic by definition. Therefore, this publication uses the terms White, Black, Asian/Pacific Islander, American Indian/Alaska Native, and Two or More Races throughout, without the additional "non-Hispanic" term. When comparing to prior years' data or across data sources, the exact classification can vary by year and source. For more information, please see Appendix C: Technical Information and Methodology.

CHAPTER 3. REGIONAL AND STATE VARIATION

The national projections of the total number of public and private high school graduates for the school years covered in this edition (2000-01 through 2031-32) mask significant variations among the nation's four geographic regions (shown in Figure 3.1, as defined for this publication).¹ As illustrated in Figure 3.2, two overriding patterns have been identified among the four regions throughout the years projected: growth in the number of high school graduates in the South and West, and continuing declines in the number of high school graduates in the Midwest and Northeast.²

Growth in the South and West

The South is the engine of growth for high school graduates. It is the only region that is projected to experience an increase in the number of high school graduates for every year of the projections, even though that number is expected to contract after 2025. In the early 2000s, about one-third (33 percent) of the nation's high school graduates were located in the Southern states, and the region's share of the national total grew to 43 percent, or 1.23 million high school graduates, by the last confirmed year, 2013.

Figure 3.1. Regional Divisions of the U.S.

During the few years of high growth that are expected to end around 2025, it is projected that states in the South will generate almost 47 percent of the nation's high school graduates, or 1.35 million graduates. By that point, it is projected that the number of graduates in the South will be about 10 percent more than the 2013 figure. After this high point, the South is projected to produce about 45 percent of the nation's high school graduates through the end of the

Figure 3.2. Total Public and Private High School Graduates, by Region, 2000-01 through 2031-32

projection period – an average of 1.25 million high school graduates per year.

Figure 3.3 shows each region’s contribution to the projected change in the number of graduates at several points in time, relative to the last year of reported high school graduate counts (2012-13). The West generated 25 percent of the nation’s high school graduates in the early 2000s. By 2009-10, high school graduates from the West represented about 29 percent of the total (813,400 graduates); that number is projected to be about 30 percent of the total throughout the projection period. The West is projected to reach its new high point in 2023-24 with about 860,000 high school graduates. It will remain the second-highest-producing region behind the South during the course of these projections, although it is expected to drop back slightly to 28 percent of the

total (on average, about 785,000 graduates) by the early 2030s.

Four of the 10 states that produce the greatest number of high school graduates are located in the South and West (see Table 3.1). In 2012-13, these four high-producing Southern and Western states generated about 1.05 million high school graduates (30 percent of the U.S. total); California alone produced 455,900 (13 percent of the total), Texas added another 9 percent (314,400 graduates), Florida another 5 percent (176,300 graduates) and Ohio another 4 percent (135,000 graduates). By 2025-26, Texas is projected to gain 2 percentage points in the share of the U.S. total, while California will drop a percentage point.

In 2025-26, Georgia (110,000 graduates) and Virginia (93,000) will round out the top five Southern states that generate the largest number of high school graduates in that region, while Washington (77,000 graduates), Arizona (72,000), Colorado (62,000) and Oregon (38,000) will join California as the top five states in the West.

Figure 3.4 on the following pages show these trends in more detail. Each state’s year-over-year change is shown, grouped by region and sorted by the state’s relative number of high school graduates. Years with fewer graduates than the previous year are shown as blue, years with about the same number of graduates

are neutral-colored, and years with more graduates are shown as orange.

As shown in the figure, between 2000-01 and 2012-13, the number of graduates increased in the earlier years, and more often in the Southern and Western states, than in the Midwestern and Northeastern regions. Between 2013-14 and 2020-21, the overall number of high school graduates is expected to plateau and even decrease slightly while declining more steeply in the Midwest and Northeast. Generally speaking, most states are projected to experience increases between 2021 and 2025, and higher rates of increases are projected for the South and West than the Midwest and Northeast. Most, if not all, states are then projected to experience year-over-year decreases for five to six years between 2025 and 2030. Then about half the states, mostly in the South and West, are projected to see slight increases in the last two years or so of the projections.

Decline in the Northeast and Midwest

The number of high school graduates in the Midwest and Northeast regions is, generally speaking, in decline. In 2012-13, the Midwest generated 22 percent of the nation's high school graduates (about 762,000). That share is projected to decrease to 19 percent by 2029-30, meaning 93,000 fewer high school graduates by that time (a decline of 12 percentage points compared to 2012-13). The trend is broadly the same for the Northeast, which produced around 639,000 graduates in 2012-13, or 18 percent of the national total. By 2029-30, the number of high school graduates in the Northeast is projected to decrease to around 567,000 graduates. This number will represent 72,000 fewer graduates by 2029-30 (a decline of 11 percentage points compared to 2012-13), and will lead to the Northeast contributing only 16 percent of the nation's high school graduates by that point.

Whereas the number of high school graduates in the South and West will show moderate increases in the next 10 years before heading into the slump caused by the recent decline in birth rates, the decline in the number of high school graduates in the Midwest and Northeast is projected to play out consistently year-over-year without pause. In the Midwest, several years

of slight increases are projected between 2021-22 and 2026-27, but this increase will not be enough for the region to reach its previous high number of high school graduates.

Six of the 10 states that together produce around 55 percent of the nation's high school graduates are located in the Midwest and Northeast regions (see Table 3.1). In 2012-13, these six Midwestern and Northeastern states produced about 866,000 high school graduates, or 25 percent of the total number of high school graduates in the U.S. By 2025-26, this number is projected to decline to about 816,000 graduates, or 23 percent of the national total.

Indiana (111,200 graduates) and Missouri (72,700 graduates) round out the five Midwestern states that produced the greatest number of high school graduates in the region in 2012-13. The number of high school graduates in Indiana is projected to decrease throughout the projection period, while the number of graduates in Missouri will increase a little between 2020 and 2025 before ending the projection period down about 3 percent from 2012-13. Massachusetts and Connecticut round out the five Northeast states that produce the greatest number of high school graduates in that region; both states are projected to experience declines in the number of high school graduates throughout the course of the projection period.

Declines are the Result of Decreasing Numbers of White Graduates

The overriding source of the decline in the number of high school graduates in the Midwest and Northeast regions, and nationally in states that have a high proportion of White youth, is the ongoing decline in the White youth population. This trend is illustrated in Figures 3.5 through 3.8, which show the regional distributions and changes in public high school graduate populations by race/ethnicity over the projected years.³ Currently, the Midwest generates about 30 percent of the nation's White public high school students; this portion is projected to decrease by 15 percent from 527,600 in 2012-13 to 490,000 by 2024-25, and to 445,800 by the end of the projection period (Figure 3.5). The Northeast generates about

Figure 3.4. Annual Percent Change in Total High School Graduates, by Region and Number of Graduates, School Years 2000-01 to 2012-13 (Actual) to School Years 2013-14 to 2031-32 (Projected)

20 percent of the nation’s White public high school students, but by the end of the projection period that share is expected to drop to 18 percent as the number of White public high school graduates in the Northeast is projected to decrease from 365,100 in 2012-13 to 305,200 by 2024-25, and to 271,500 by the end of the projections – a decrease of 26 percent (see Figure 3.6).

The reduction in the White youth population also affects the West and South, even if it does not lead to regional declines overall. Figure 3.7 shows the number of White public high school graduates from the West will decline over the course of the projections, from about 356,000 in 2012-13 to about 343,000 by 2024-25 (going from about 45 percent of the national number to about 37 percent). The number of White public high

school students in the South is projected to decline, as well, although by less than the West – from 590,000 in 2012-13 to 585,000 in 2024-25, as the South will gain in share of the national total of White public high school graduates, from 37 percent to 40 percent between 2012-13 and 2024-25 (see Figure 3.8).

The number of high school graduates from private schools is projected to decline in all regions. And while it is not possible to precisely tie this decline to any factor, and indeed it is likely related to multiple factors, the reduction in the White youth population is logically a strong factor in the decline of the private school population (as 70 percent or more of students at private high schools have been White, historically).⁴

Figure 3.5. High School Graduates by Region and Race/Ethnicity – Midwest

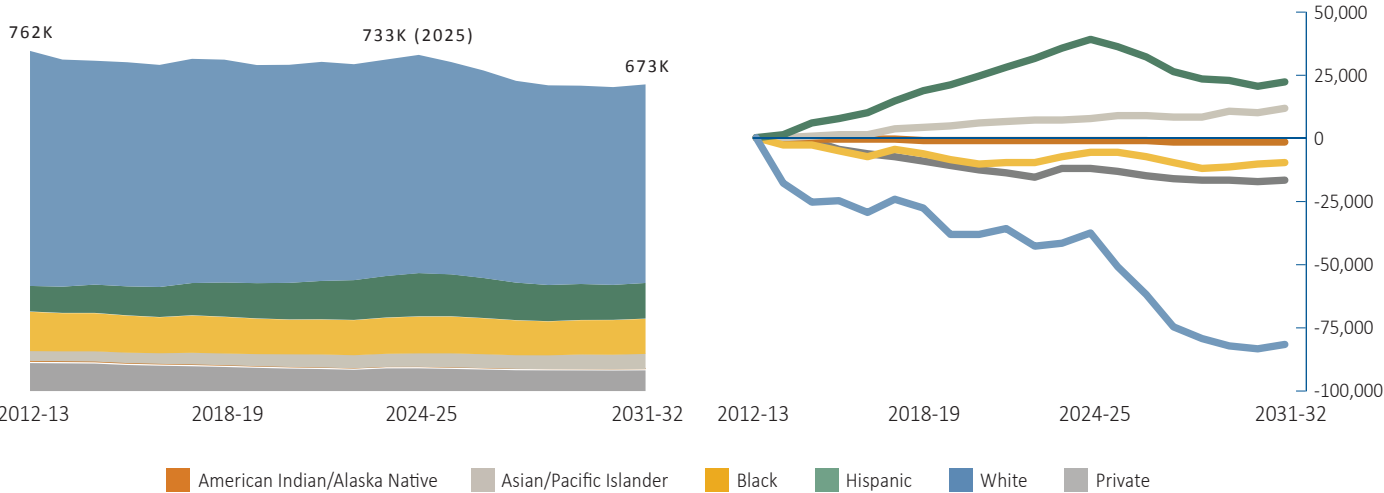

Figure 3.6. High School Graduates by Region and Race/Ethnicity – Northeast

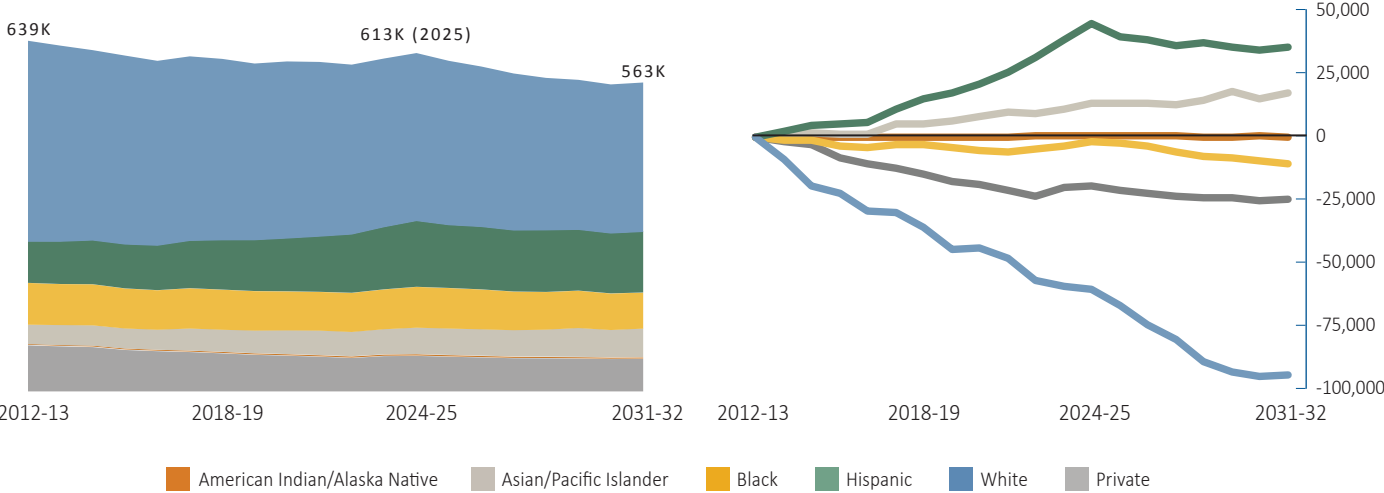

Figure 3.7. High School Graduates by Region and Race/Ethnicity – West

Figure 3.8. High School Graduates by Region and Race/Ethnicity – South

Other Factors Contributing to Declining Numbers

The patterns vary by region and state, but for the purpose of this summary, Black public high school graduates are a factor in the declines seen in the Midwest and Northeast, and to a lesser extent, in the West. Only in the South are Black public high school graduates a growth factor. The number of Black public high school graduates in the Midwest and Northeast peaked around 2010-11 and is projected to decline incrementally over the course of the projections, compounding the declines in the number of White high school graduates in these regions. The number of Black public high school graduates in the Midwest are projected to decline about 6 percent from 87,800

in 2012-13 to 82,200 by 2024-25, and will decline another 6 percent after that point, to a low of 75,800 in 2028-29. The Northeast is projected to see similar rates of decline among the number of Black public high school graduates, dipping slightly from 75,600 in 2012-13 to 73,900 by 2024-25, and then dropping to 65,200 in the last projected year, 2031-32 (about 14 percent fewer between 2012-13 and 2031-32). As for the West, which contributed 9 percent of the nation's Black public high school graduates in 2012-13 (about 42,000) – by 2024-25, the number of Black public high school graduates is projected to drop in number (to about 34,000), to 7 percent of the nation's total Black public high school graduates.

The number of American Indian/Alaska Native public high school graduates is projected to decrease in every region over the course of the projections. This is most notable for the West, which encompasses almost half of the nation's American Indian/Alaska Native public high school graduates. In 2012-13, there were 14,400 American Indian/Alaska Native public high school graduates in the West (45 percent of the national number), which is about 2 percent of all public high school graduates in the West. By 2024-25, the West will have about 12,000 American Indian/Alaska Native public high school graduates (47 percent of the projected number nationally that year) and the South will have about 8,800. American Indian/Alaska Native public high school graduates are 1 percent or less of all public high school graduates in the Midwest and Northeast. In the Midwest, there are projected to be 30 to 35 percent fewer American Indian/Alaska Native public high school graduates by the early 2030s, down from about 4,000 in 2012-13 to about 2,600 in the last several projected years. In contrast, the Northeast is projected to have greater numbers of American Indian/Alaska Native public high school graduates over the course of the projections, up about 30 percent around 2025 and 20 percent by the early 2030s (about 2,100 and 1,800 respectively).

Growth is the Result of Increasing Numbers of Non-White Graduates

Just as the declining number of White youth is the key driver of projected declines in the number of high school graduates in the Northeast and Midwest, rapid increases in non-White student populations are fueling the growth in the number of high school graduates in the South and West. The previous illustrations (Figures 3.5 through 3.8) highlight the swift, substantial increases among Hispanic public high school graduates, particularly in the South and West, but also to a smaller extent in the Midwest and Northeast. Asian/Pacific Islander high school graduates are fewer in number, but contribute to the increasing number of high school graduates in all regions over the course of the projections. The patterns for Black and American Indian/Alaska Native public high school graduates differ from each other, but the numbers are predicted to either remain generally stable or decline slightly in some years.

The South generated 36 percent (229,000 graduates) of the nation's Hispanic public high school graduates and 57 percent (268,000 graduates) of the nation's Black public high school graduates in 2012-13. By 2024-25, the number of Hispanic and Black public high school graduates from the South is expected to increase to about 366,000 and 282,000 graduates, respectively, or 40 percent and 60 percent of the nation's total Hispanic and Black public high school graduates.

In 2012-13, the West generated 43 percent of the nation's Hispanic public high school graduates (about 279,000 graduates). By 2024-25, the Western states are projected to generate about 341,000 Hispanic public high school graduates, which by then will represent 37 percent of the total number of Hispanic public high school graduates in the nation. The number of Hispanic high school graduates in Southern states (including Texas and Florida) is projected to surpass that generated by the West by 2022-23.

While the Midwest and Northeast are, generally speaking, experiencing a decline in the number of high school graduates they produce, these two regions are projected to experience an increase in the size of their Hispanic public high school populations similar to that of the overall national trend. The Northeast generated about 12 percent of the nation's Hispanic graduates (about 76,000 graduates) in 2012-13. The number of Hispanic public high school graduates in the Northeast is projected to increase rapidly, reaching about 121,000 graduates by 2024-25, which will be 13 percent of the nation's total number at that point. The strong increases in the number of Hispanic public high school graduates will mean that by 2024-25, for every 10 fewer White public high school graduates in the Northeast there will be eight additional Hispanic graduates, just short of replacement. Along these lines, in the Midwest between 2012-13 and 2024-25, the declining number of White public high school graduates (a decrease of about 37,500 graduates) will be offset almost one-to-one by the projected increases in Hispanic public high school graduates (an increase of about 39,200 graduates). By 2024-25, the Midwest is projected to be producing about 10 percent of the nation's Hispanic public high school graduates.

In 2012-13, the West produced 47 percent of the nation's Asian/Pacific Islander public graduates (about 86,000 graduates). The West's contribution to the total number of Asian/Pacific Islander public high school graduates is projected to decrease to about 76,000 graduates by 2024-25 (35 percent of the national total) while the number of Asian/Pacific Islander graduates from the South and Northeast grows. In the South, the number of Asian/Pacific Islander high school graduates is expected to increase significantly, though this number is not expected to exceed those of Hispanic and Black public students in the region. In 2012-13, Asian/Pacific Islander graduates in the South represented 21 percent of the national total of Asian/Pacific Islander public high school graduates, or about 40,000 graduates. The number of Asian/Pacific Islander public high school graduates in the South is projected to increase to about 58,000 by 2024-25, representing more than a quarter of the nation's total number of Asian/Pacific Islander graduates.

The Asian/Pacific Islander public high school graduate population is the only racial/ethnic category that is expected to show growth over the entire course of the projections, including in the Northeast and Midwest. The number of Asian/Pacific Islander public high school graduates in the Northeast is projected to increase from about 37,000 in 2012-13 to almost 50,000 by 2024-25, representing an increase from 20 to 23 percent of the national number of Asian/Pacific Islander public high school graduates over these years. The number of Asian/Pacific Islander public high school graduates in the Midwest is projected to increase from about 23,000 in 2012-13 to about 30,500 by 2024-25, representing 12 to 13 percent of the national number of Asian/Pacific Islander public graduates at either point.

State Variation

The projections for the nation and the four regions mask significant variation among the states in terms of overall number of graduates, racial/ethnic composition, and change over the projected years and in terms of whether state trends track or diverge from the national or regional trends. The data presented in Figures 3.4 and Figure 3.9 highlight the variation.

Figure 3.4 shows the overall trend of annual growth or decline by state, and shows the variation by state. The robust growth that occurred during the 2000s (across most of the states) is clear, but it also becomes evident that there was wide variation by state in the annual rates of growth or decline over those 10 to 12 years. A different pattern emerges by school year 2010-11 or 2011-12, with a predominantly downward trend in most states predicted through 2016-17 and moderated growth rates or even declines for many states. Then, between school years 2017-18 and 2024-25, the South and West regions are generally projected to have increases in the number of high school graduates overall.

But, Figure 3.4 highlights how this overall increase arises from only about half of the states in these two regions, while many states in the South and West are instead projected to experience virtually no growth or even decline for about five of those years. On the other hand, the Midwest and Northeast regions are generally projected to produce fewer high school graduates during these same years (2017-18 to 2024-25). But, Figure 3.4 demonstrates that a number of Midwest states, in particular, are projected to depart from that trend and have some years of growth. Towards the final projected school years, 2029-30 and onward, Figure 3.4 shows a reversal with many of the states returning to growth, primarily in the South and West regions but even in the Midwest and Northeast.

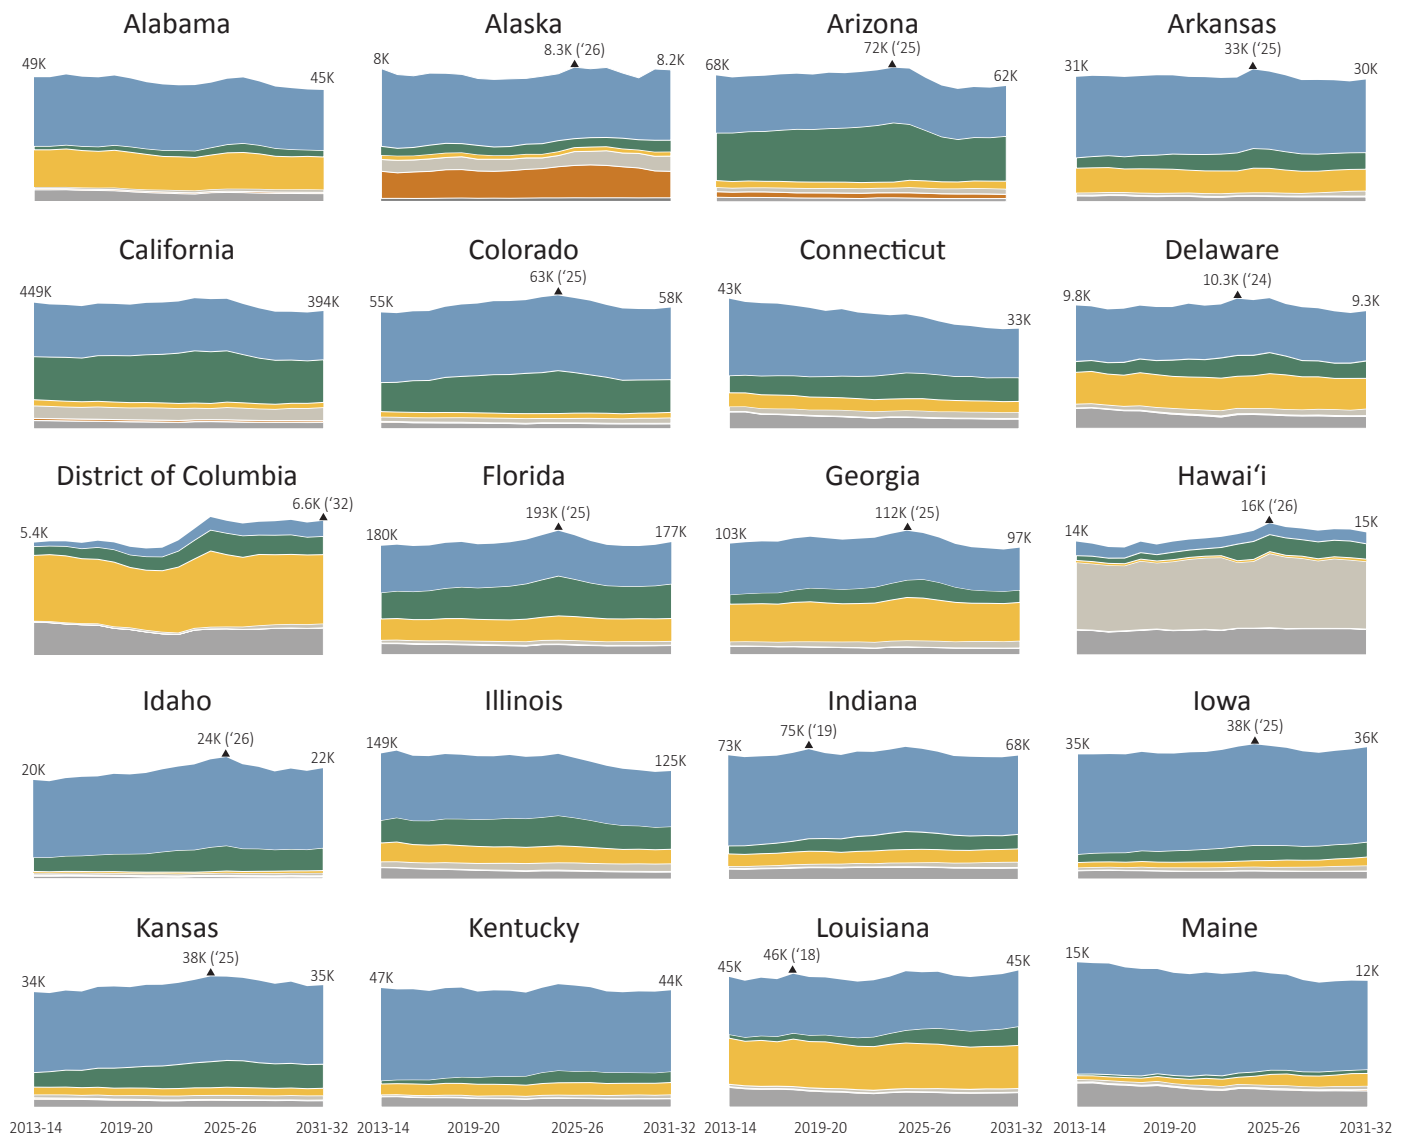

The area charts in Figure 3.9 on the following pages highlight a different aspect of state variation – the distribution of high school graduates by race/ethnicity in each state. The race and ethnicity of public high school graduates is shown by the color of each chart section; the portion of each states' high school graduates that are from private high schools is also shown, in the grey bottom section. The state area charts in Figure 3.9 can be compared to the distribution of graduates by race and ethnicity by region as seen in Figures 3.5 through 3.8, and to the national distribution of graduates by race and ethnicity in Figure 2.4 in Chapter 2. Several things stand out, for example:

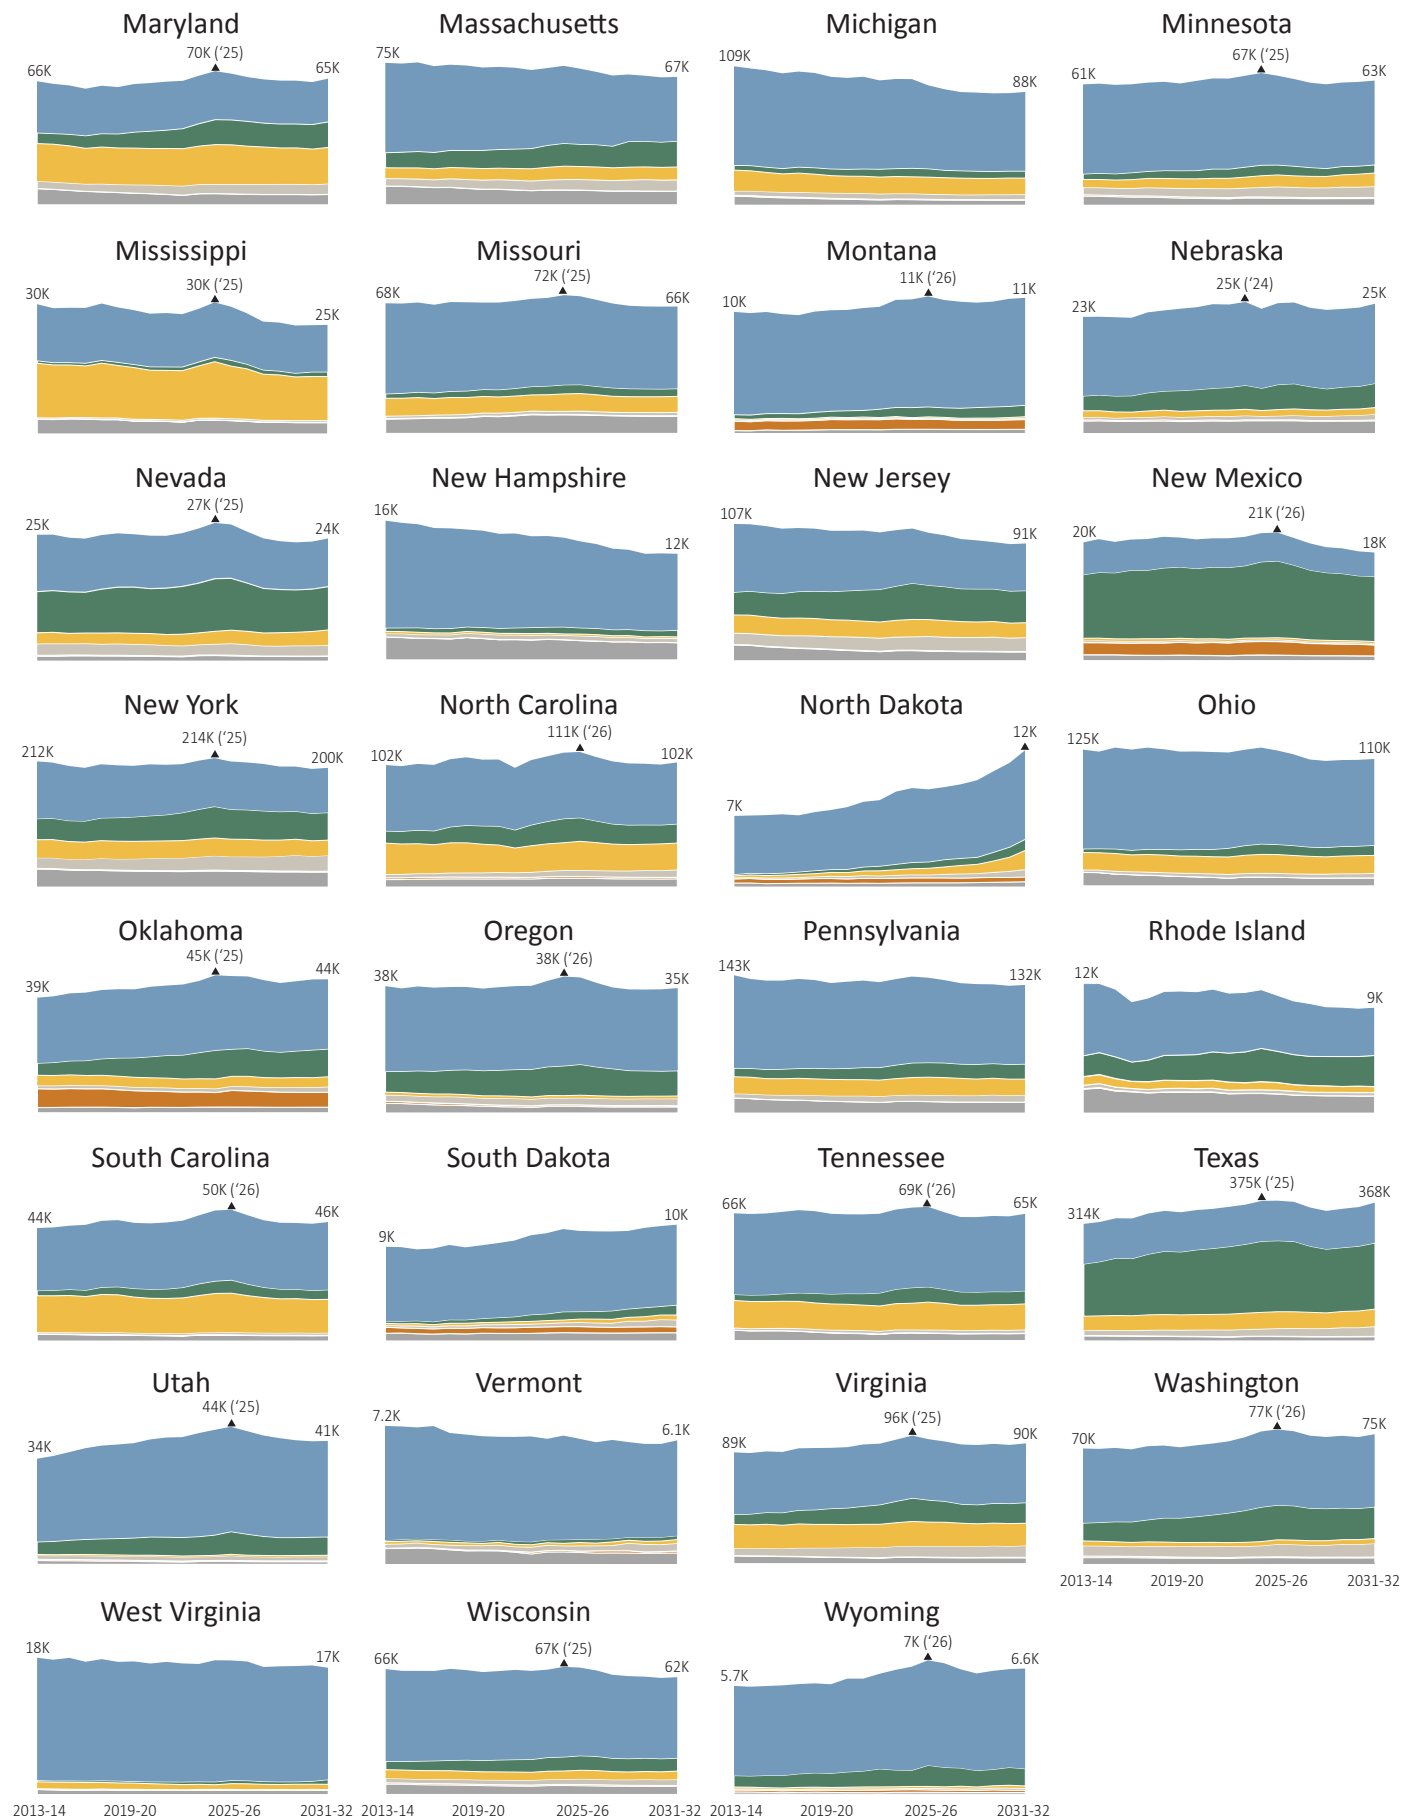

Figure 3.9. Projected High School Graduates, 2013-14 to 2031-32, Public by Race/Ethnicity, and Private

After 15 years of consistent growth, the number of high school graduates nationally has moderated and is projected to be relatively the same through about 2024-25, when the nation is projected to achieve a new high of 3.56 million graduates, made possible by increases in the number of graduates of color. After this, the number of graduates is projected to decline into the early 2030s.

These area charts display projections data from Appendix A: High School Graduate Data Tables.

- ▶ These area charts highlight that in very few states, if any, are there projected to be increases in the number of White public high school graduates as shown in blue. Rather, the reduction in White public high school graduates underlies the overall decreases in high school graduates. This is particularly striking for Northeast states like Connecticut and Maine, and Midwest states like Illinois and Michigan.
- ▶ The substantial portion of all high school graduates which are Hispanic may not be a surprise for states such as Texas and New Mexico as shown in green. But, the growth in the portion of graduates that will be Hispanic may be surprising for states like Oklahoma and Nebraska. And, these area charts illustrate how for many states the growing population of Hispanic high school graduates adds to any overall future increases in high school graduates. Also, it is evident that the projected increases in Hispanic graduates in some states offset the reduced number of graduates of other races, particularly White. But, in other cases, Hispanic graduates appear to overtake the portion of high school graduates that is Black.
- ▶ While American Indian/Alaska Native graduates are only about one percent of high school graduates nationally, the area charts in Figure 3.11 highlight which states generate the vast majority of these graduates – Alaska, Montana, New Mexico, North Dakota, Oklahoma, and South Dakota.
- ▶ Similarly evident from these area charts are the states for whom Black high school graduates are a substantial portion of overall graduates.

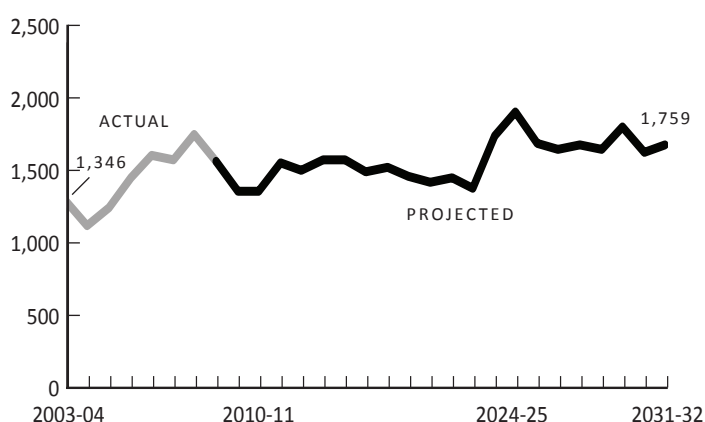

First-Time Projections for U.S. Pacific Territories and Freely Associated States

For the first time, WICHE attempted projections for outlying U.S. Pacific territories and freely associated states. The U.S. Pacific territories and freely associated states are members of WICHE. WICHE produced projections for Guam, but was unable to do so for the Commonwealth of the Northern Mariana Islands due to data limitations. WICHE also produced projections for Puerto Rico for the first time, given its connection to the U.S. and frequent exchange of individuals through migration. For each of these entities, WICHE was only able to obtain the data necessary to produce

projections for overall public school students and graduates (additional information can be found in Appendix C).⁵

Steady production of graduates in Guam. Guam public schools produced between 1,200 and 1,800 high school graduates in the years between 2003-04 and 2010-11 (see Figure 3.10). The projections indicate that Guam will continue to steadily produce an average of 1,500 public high school graduates per year through the Class of 2023, after which it appears there will be an uptick in high school graduates to about 1,800 on average, per year, related to growth in the number of births from 2006 to 2012 and good enrollment progression.⁶

Figure 3.10. Guam Public High School Graduates, 2003-04 to 2031-32

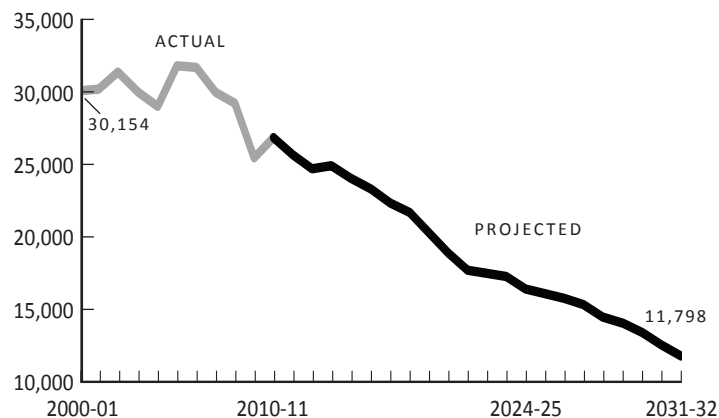

On average, 88 percent of public school enrollments are reported as Asian/Pacific Islander; 97 percent of high school graduates. Three-quarters of the combined Asian/Pacific Islander students in 2010-11 to 2013-14, the years data were available, were reported as Pacific Islander or Hawai'ian Natives (this race detail was not available in the high school graduates data). There are also four Department of Defense schools in Guam with about 2,500 students and a hundred or less 12th graders in recent years (2006-07 to 2014-15).⁷

Striking declines in graduates in Puerto Rico. After several decades of population and economic growth, Puerto Rico has seen a rapid decline in population in the last decade or so.⁸ These significant population declines are showing in steady school enrollment

declines, which are set to begin showing in high school graduates. Puerto Rico public schools produced between 29,000 and 32,000 high school graduates in the years between 2000-01 and 2008-09 (see Figure 3.11). The declines in births and enrollments begins to show at the high school level most notably beginning in 2009-10, and continuing in each subsequent year. The projections indicate that the Class of 2020 public high school graduates will fall below 20,000 in Puerto Rico. And that by the Class of 2028, there will be less than half the number of public high school graduates as 20 years prior, below 15,000.⁹ Practically speaking, virtually all of the public school students/graduates are considered Hispanic.¹⁰ It appears that about 75 percent of K-12 students are enrolled in the public sector. While WICHE did not obtain sufficient data to separately project the number of graduates from private high schools, an additional 13,000 to 14,000 high school graduates were reported by private schools in Puerto Rico in the 2010-11 to 2013-14 school years.

Figure 3.11. Puerto Rico Public High School Graduates, 2000-01 to 2031-32

Regional and State Variation Summary

This chapter illustrates the projected trends in the regions, including the number of graduates and demographic makeup over the course of the projected period. Each state has its own particular variations, of course, which are a result of complex state-specific factors. Several overriding patterns, however, can be discerned for the next 15 years or so. The South and West currently produce the greatest number of graduates and are likely to experience generally robust growth in the number of high school graduates over the next decade. The Midwest and Northeast can generally be described as in decline overall. All regions will face projected declines in the number of high school graduates after about 2025, roughly a decade from now, but the magnitude of those declines will be quite different. The extent, pace, and magnitude of growth or decline are closely related to the racial/ethnic composition of the youth populations in these regions and states. Generally speaking, the more diverse the population, the better the region or state appears to fare over the course of the projections in terms of either increases in the number of high school graduates, or at least lesser declines. Inversely, states or regions with a greater portion of White youth stand to experience greater declines in the number of high school graduates throughout the course of these projections, as the White youth population declines in number.

Endnotes

¹ The regional divisions are consistent with those established by the U.S. Census Bureau, with the exception of North Dakota and South Dakota, which are included in the Western region, as they face many of the same conditions and share a number of attributes with neighboring Western states, such as Montana and Wyoming, and are also WICHE states. The U.S. Pacific territories and freely associated states are also WICHE members, but due to data limitations, were not included in the calculations for the regional projections and are therefore not displayed on the map. See Appendix A for Guam's and Puerto Rico's public high school graduate data tables.

² Unless otherwise noted, years for high school graduates refer to the end of the K-12 school year, e.g., May 1997 of the 1996-97 school year. The first projected year is different between public and private school graduates, due to differences in data availability. Public high school graduates represent 91 percent or more of the total number of graduates, and therefore when this publication refers to the total number of public and private high school graduates or to public school graduates alone, it is referring to the first year of projected graduates as the 2013-14 school year, or the Class of 2014. When this publication focuses on private school graduates alone, the first year of projected graduates is for the 2011-12 school year, or the Class of 2012.

³ Due to data limitations, projections by race/ethnicity are limited to public high school graduates.

⁴ National Center for Education Statistics, Private School Universe Survey (PSS), Data Tables, Washington, DC: U.S. Department of Education National Center for Education Statistics, accessed October 13, 2016, <https://nces.ed.gov/surveys/pss/>.

⁵ Complete data were not available from the NCES Common Core of Data, so WICHE requested assistance obtaining data from officials in Guam, Puerto Rico, and the Commonwealth of the Northern Mariana Islands, but found that data for these entities is generally less complete and detailed than necessary.

⁶ The data obtained that report 6 to 13 percent more high school graduates than the number of 12th graders suggest that totals including these additional graduates would be as much as 15 percent higher in any given projected year if WICHE used those data. These data were not used because WICHE considered them anomalous.

⁷ U.S. Department of Defense Education Activity (DoDEA), Pacific Area Guam Schools enrollment data at http://www.dodea.edu/datacenter/enrollment_display.cfm. WICHE was not able to obtain data on the number of graduates from private high schools in Guam.

⁸ Jens Manual Krogstad, *Historic Population Losses Continue Across Puerto Rico*. Washington D.C.: Pew Research Center, 2016, accessed May 15, 2016, <http://www.pewresearch.org/fact-tank/2016/03/24/historic-population-losses-continue-across-puerto-rico/>; Jaison R. Abel, Richard Dietz, "The Causes and Consequences of Puerto Rico's Declining Population," Federal Reserve Bank of New York (2014), accessed May 15, 2016, www.newyorkfed.org/medialibrary/media/research/current_issues/ci20-4.pdf. From April 2010 to July 2015 Puerto Rico is estimated to have lost 295,718 citizens to out-migration, which includes migration to the mainland United States. There are several possible reasons for the rapid increase in migration to the mainland United States, the most important of which is the economic climate in Puerto Rico. High unemployment and a weak economic outlook plays a large role in out-migration from the island, especially for younger and less educated individuals. Although it is unclear how many school-age children are migrating from Puerto Rico to the United States, the large number of 16-30 year olds who are migrating has the potential to affect future education enrollment.

⁹ The data obtained that appear to have included all diploma recipients, including non-standard and those from special schools, suggest that totals including these diploma types may be as much as 20 percent higher in any given year, but with the same rate of declines related to overall birth and population declines.

¹⁰ WICHE did not have sufficient data to attempt projections by race/ethnicity, but, on average 95 percent of births were classified as Hispanic between 2005 and 2014 (the years that births data were available by race/ethnicity), and virtually 100 percent of public school enrollments were classified as Hispanic in the available data.

CHAPTER 4. ENROLLMENT PROJECTIONS

WICHE relies on data about the number of recent births and enrollment counts to generate the projections in *Knocking at the College Door*. While these births and enrollment data are not the focus of this publication, WICHE provides them because they provide useful information about the children who will ultimately move through the educational pipeline and emerge as high school graduates over the course of the next 15 years or so.

Trends with Younger Youth Drive High School Graduate Production

A few highlights from these data help illustrate what is behind the projected overall reduction in the number of high school graduates and how the changing racial/ethnic composition of America’s youth population contributes to that trend.

Births

Declines in the number of babies born in recent years in the U.S. will result in smaller graduating classes, projected to begin by 2025 and into the early 2030s. Figure 4.1 shows the recent decline in births nationally beginning around 2007. Essentially, the total U.S. fertility rate is teetering at or below replacement

level, which is the estimated level of fertility that is necessary for a population to sustain itself assuming no in-migration or out-migration.¹

The story appears a little different when looking at the various racial/ethnic populations. A decline in White youth has been predicted for years.² This long-anticipated reduction was then amplified as birth rates declined substantially for all populations after 2007. In other words, the long-predicted contraction in the number of White high school graduates unfolds throughout the course of these projections, but is compounded by the recent sharp declines in births. The other races also experienced declines further amplifying the decline in the overall number of high school graduates, because non-Whites had previously been the driver of growth in the number of school-age youth. In particular, the largest relative declines in births/fertility rates occurred among Hispanic women.³

Regional views provide another perspective on these trends. Figure 4.2 shows changes in the overall numbers and the racial/ethnic profiles of births between 1990 and 2014 by region.⁴ Declines in the numbers of White births in the Midwest and Northeast

Figure 4.1. Births in the U.S., 1990-2014

are clear, while increases in the share of non-White individuals increased in each region.

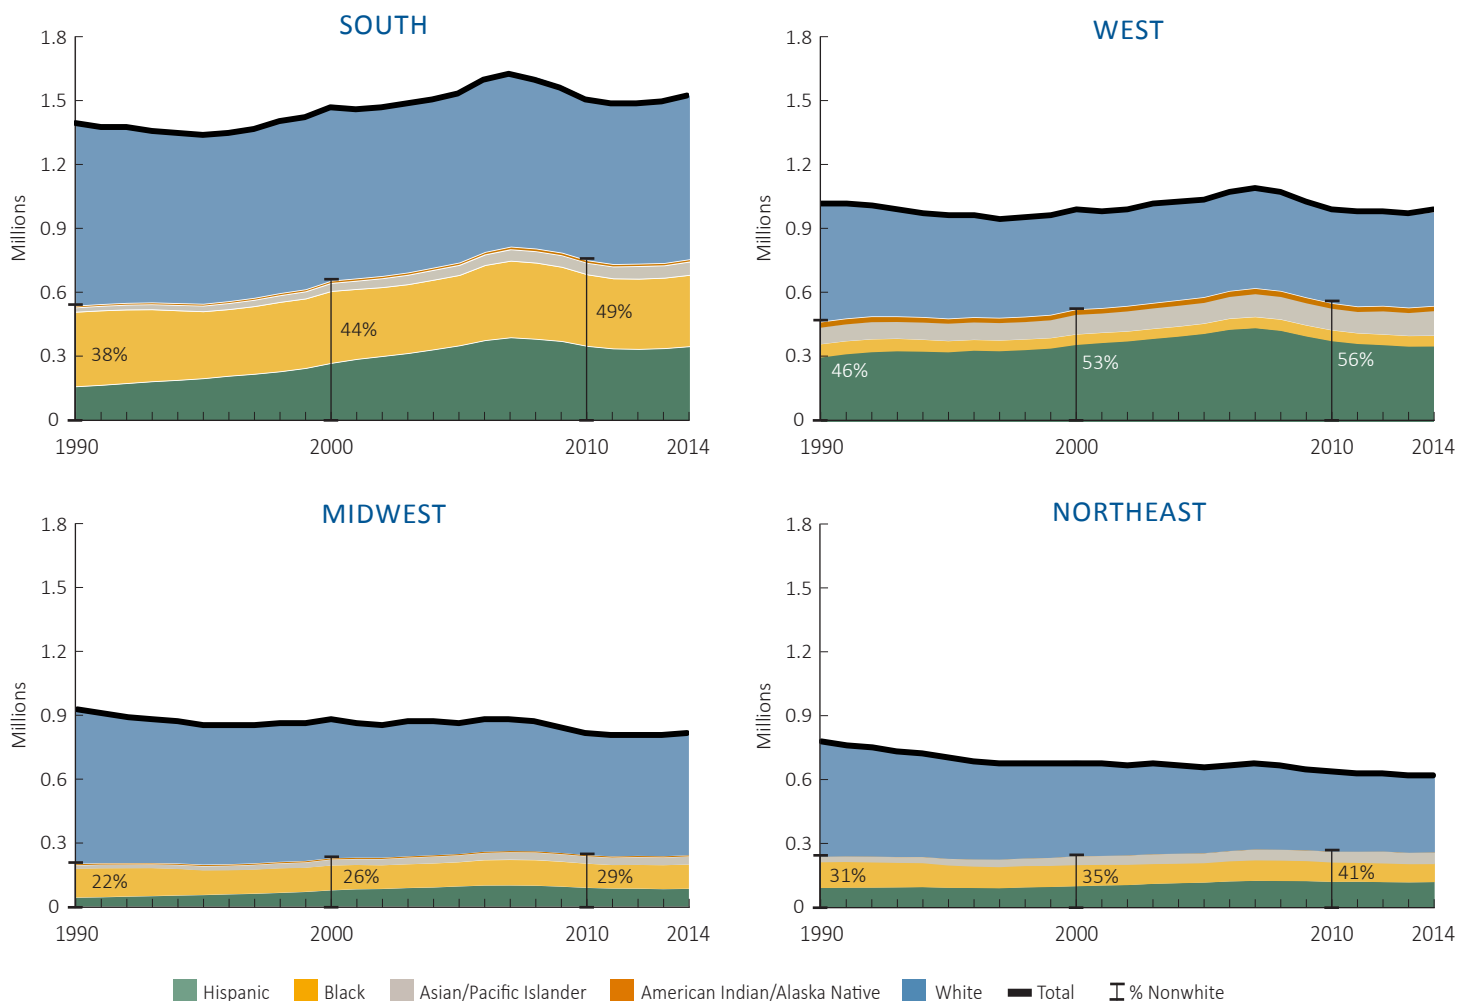

Progress Through the K-12 Pipeline

As students move through the K-12 pipeline, a variety of factors determine how many and which students will progress all the way through to high school graduation. For example, students move between private and public schools, families move to different states and even different countries, and children change schools and may be either promoted early or retained in a grade. Changes in policies and practices can also potentially impact their progress through the pipeline, as can differences related to their race/ethnicity and changes in their family and economic circumstances. While the primary underlying

explanation for the declining numbers of high school graduates is the reduced number of births, enrollment patterns reveal information that highlights different progression patterns and where improvements could be made to ensure that the greatest possible number of children graduate from high school.

Ideally, the many factors, which relate to how and whether students progress as expected through grade levels to high school graduation could be quantified, but precise information about these complex underlying trends is difficult to find. Therefore, WICHE does not explicitly model these factors. Instead, these projections rely on a relatively simple and straightforward methodology that observes the percentage of students in one grade who are encompassed by the number of students in the next

Figure 4.2. Births by Race/Ethnicity, by Region, 1990 to 2014

higher grade the following year (described in Chapter 1 and in more detail in Appendix C). This method has advantages and disadvantages for developing projections, but the methodology is considered sound; furthermore, other educational agencies use similar cohort survival methods for producing projections.

Projected Enrollments

School planners will find these enrollments projections useful for anticipating the current and near-future waves of students as they evaluate capacity and funding for future school years (high school enrollment projections for the nation and region are presented in Appendix B). The national enrollment trends mirror those described for the graduates, except that most of the changes occur nearer in the future than with high school graduates.

Figure 4.3 depicts enrollments by school level (elementary, middle, and high school grades), and by race/ethnicity. WICHE is able to project high school enrollments further into the future than earlier grade enrollments, so this figure displays only the projected middle and high school enrollments in the later years, while earlier grades are shown as “not available.” Although elementary grade enrollments are projected through 2020-21 only, the data clearly show how the recent declines in birth rates begin to flow into the school pipeline in terms of reductions in the number of elementary grade enrollments (the lightest shade shown on the charts) from 2000 to 2020.

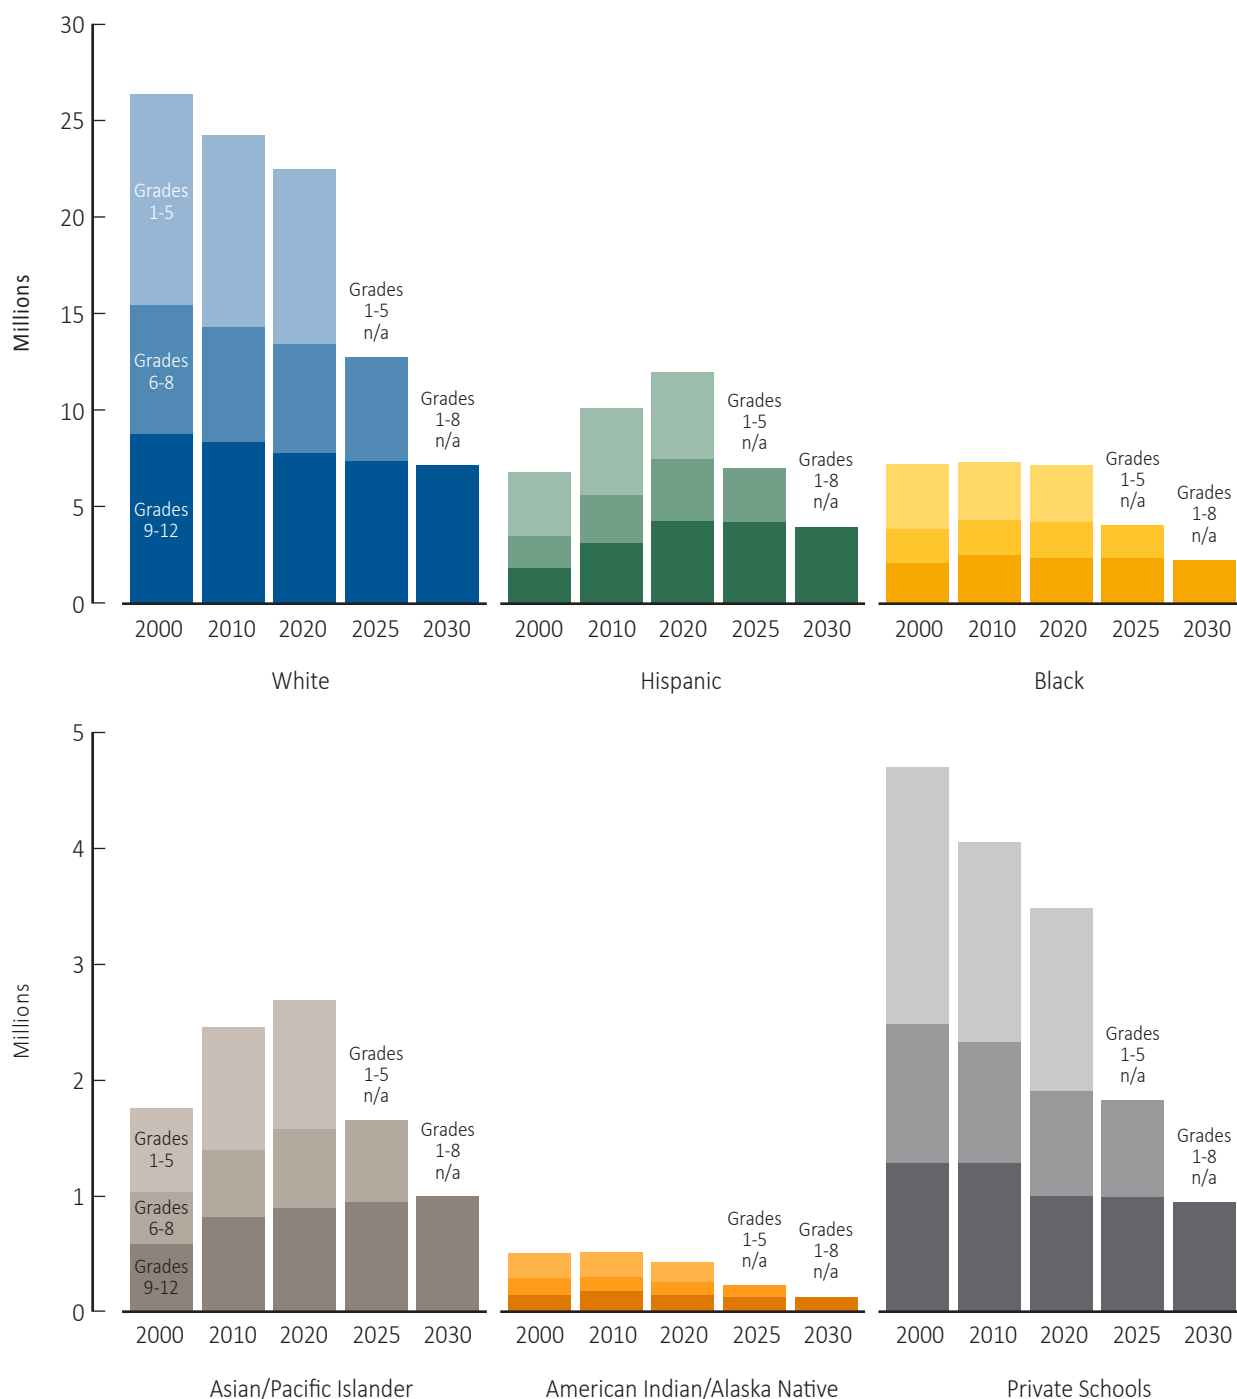

White public school students. The greatest declines are among the numbers of White public school students, whose enrollments declined 8 percent (from 26.3 million to 24.2 million) between 2000-01 and 2010-11, and are projected to decline another 7 percent (to 22.4 million) by 2020-21. White students comprised 54 percent of total public school enrollments in the 2010-11 school year, and 56 percent of middle and high school enrollments, respectively (the two darker shades shown on the charts). By school year 2020-21, White students are projected to represent just 50 percent of public school enrollments overall, and this number is projected to dip below 50 percent in the middle and high school

grades by school year 2028-29, the last year of WICHE’s high school enrollment projections.

Hispanic public school students. With respect to Hispanic students, the data show just how substantial was their contribution to public school enrollments overall between 2000 and 2010, increasing from 6.8 million in 2000-01 to 10.1 million in 2020-21 – an increase from 16 percent to 23 percent of all public school students. Compare this increase of 3.35 million Hispanic students over those 10 years to the 2.10 million decrease in the number of White students. By grade level, the number of Hispanic public elementary school students increased 39 percent, by 49 percent at the middle school level, and by 68 percent at the high school level. The number of Hispanic middle and high school students is projected to continue increasing at a swift pace, by 29 percent and 35 percent, respectively, between 2010-11 and 2020-21. However, the previous rates of increase do not appear to be sustained at the elementary school level, at which the number of Hispanic elementary school students is projected to increase by only 1 percent through 2020-21. This significant slowdown is related primarily to the recent declines in birth rates, and perhaps to reduced immigration as well. Past 2020-21, trends in the number of Hispanic public high school students will follow the overall trend downward. By school year 2020-21, Hispanic students are projected to account for 26 percent of all public school first- through fifth-graders. Also by school year 2020-21 and going forward throughout the projections, Hispanic students are projected to account for 26 to 28 percent of all public middle school and high school students.

Black public school students. The numbers of Black public school students are projected to decline somewhat throughout the course of the projections, largely in line with the overall trend. The total number of Black public school students is expected to remain relatively steady compared to the other student populations, however. The number of Black public elementary school students is projected to decline by 3 percent from 3.01 million in 2010-11 to around 2.93 million by 2020-21. The number of Black public middle school students will increase by 2 percent from 1.82 million in 2010-11 to 1.86 million students by 2020-21,

Figure 4.3. U.S. School Enrollments by Level and Race/Ethnicity, 2000-01 to 2028-29

Note: Race/ethnicity detail only available for public school students.

and then decline by about 7 percent, to about 1.74 million students, by 2025-26. The number of Black public high school students is projected to decline by 7 percent from 2.47 million in 2010-11 to 2.31 million by 2020-21, and then decline another 2 percent by 2028-29. Between 2000-01 and 2010-11, the number of Black public high school students declined by a

percentage point among total enrollments, in part due to small numerical declines but it is likely that some of the apparent reduction in numbers is related to recategorization to other racial/ethnic categories (see Appendix C for additional information). By 2010-11, Black public high school students comprised 16 percent of public school elementary and middle

school enrollments and 17 percent of public high school enrollments. The percentage of Black students enrolled in public high school is expected to remain at or very near this number throughout the course of the projections.

Asian/Pacific Islander public school students. Asian/Pacific Islander public school students are the only student population that is projected to consistently add K-12 public school enrollments throughout the projections, at all school levels. Between 2010-11 and 2020-21, Asian/Pacific Islander public school elementary enrollments are projected to increase by 7 percent (an increase of about 308,000 students), middle school students by 12 percent (155,000), and high school students by 11 percent (224,000). Even in the later years of the projections, when all other student populations are expected to decline in number, the number of Asian/Pacific Islander students is expected to increase. The projections show there will be an additional 7 percent of Asian/Pacific Islander middle school students between 2020-21 and 2025-26, and 10 percent more Asian/Pacific Islander public high school students between 2020-21 and 2028-29. The total number of Asian/Pacific Islander public high school students is projected to increase past 1 million by 2028-29.

Native Hawaiʻian/Pacific Islander public school students. Due to data limitations, WICHE was unable to produce reliable projections for Native Hawaiʻian/Pacific Islander public school enrollments. The available data, however, indicate that between 2010-11 and 2013-14, Hawaiʻian/Pacific Islanders represented about 7 percent of the total combined number of Asian/Pacific Islander students at each school level – elementary, middle, and high school (the number of Native Hawaiʻian/Pacific Islander public school students decreased about 2 percent between school year 2012-13 and 2013-14, which is somewhat contrary to the expected trend). Of course, Hawaiian/Pacific Islanders represent a substantial part of some states' populations with education outcomes that are distinct from the overall Asian/Pacific Islander population – for example, Hawaiʻi and the Pacific Northwest states. And, certain local school districts may have a substantial number of Native Hawaiʻian/

Pacific Islander students, but these lower-level enrollments do not appear as substantial when rolled up in the state-level data (see Appendix C for more information).

American Indian/Alaska Native public school students. American Indian/Alaska Native students make up roughly 1 percent of all public school students, at all levels.⁵ Overall, the number of American Indian/Alaska Native students is projected to decrease over the course of the projections. The number of American Indian/Alaska Native public elementary school students is projected to decline by 14 percent between 2010-11 and 2020-21, from about 215,000 to about 184,500 students. At the middle school level, the number is projected to decline by 13 percent by 2020-21 and another 11 percent by 2025-26, from about 131,000 students in 2010-11 to 101,500 students by 2025-26. The number of American Indian/Alaska Native public high school students is projected to decline by 28 percent (from about 175,000 to about 125,000 students) between 2010-11 and 2028-29, the last year of WICHE's high school enrollment projections.

Two or More Races public school students. Due to data limitations, WICHE was not able to produce reliable projections for public school students in the Two or More Races category. Students of Two or More Races represented 3 percent of non-Hispanic students in the first through fifth grades in 2010-11, and 5 percent by 2013-14, a 33 percent increase over these four years. In 2013-14, they represented 4 percent of non-Hispanic sixth to eighth graders, and 3 percent of high school students. Nationally, the number of reported students increased by 10 percent or more each year between 2010-11 and 2013-14. These are unusually high rates of growth, which make the accuracy of extrapolated results questionable; this is just one of several data complexities that limited WICHE's ability to produce reliable projections for this population. Reliable projections may not be possible for several years until the transition to the new reporting scheme has been fully implemented and enough stable data have accumulated (see Appendix C for more information). The apparent declines projected for American Indian/Alaska Native and Black

students are likely related to the reclassification of these students in the data under the Hispanic or Two or More Races categories.

Private School Students

The number of private school students dipped below 10 percent of total high school enrollments by school year 2010-11, and this population is projected to decline in both number and share throughout the projection period – ultimately down to 6 to 8 percent of total enrollments across school levels in the later years of the projections. The declines are projected to be steepest over the next few years, and then should level off somewhat. The number of private elementary and middle school students is projected to decrease 9 percent and 14 percent respectively from 2010-11 through 2020-21. Private high school enrollment is expected to decline 22 percent over this period. Private school enrollment at the middle school and high school levels is projected to decline at about the same rate as overall enrollments in the later years of the projections.

School Choice

According to the Center for Public Education, 16 percent or more of the school age population is enrolled in a “public school of choice” – about 4 percent each in magnet and charter schools and about 10 percent in public schools from inter- or intra-district transfer, and about 1 percent in online schools.⁶ This increasing diversification in the type of school has the potential to affect graduation trends in ways that might not be easily sensed when these students are included in the total combined public school data. Furthermore, this increasing availability of viable traditional public school alternatives, in particular, can be a contributing factor to the declines in private enrollments.⁷

Charter Schools

WICHE does not disaggregate the public school enrollments and graduates by public traditional or charter school due to data limitations. While data about the portion of the public school population that is educated by charter schools are becoming increasingly available, they are currently not available at the level of detail needed for accurate or meaningful projections.⁸

Reasons for Declines in Private School Enrollment

There are several reasons for the declines in private school enrollments. Chief among them is undoubtedly the overall reduction in the number of White youth, which have historically represented about 70 percent of the total student population for private schools. But, enrollment in private religious schools and private nonsectarian schools exhibit different patterns; the overall declines are being driven by decreases in the number of students enrolling in private religious schools. Some of these enrollment declines are associated with rising tuition costs, increased enrollment at charter schools, and suburbanization, with families who have historically represented these private school audience moving away from the schools and/or finding suburban public schools to be better than the urban schools they previously attended. In other cases, the decline is related to different preferences among immigrant populations; whereas previous generations of European immigrants tended to enroll in private (religious) schools, newer immigrant populations, such as those from Central and South America, appear to be less inclined to do so.

As a matter of context, however, from school year 1999-2000 to 2012-13, the number of students enrolled in public charter schools increased from 0.3 million to 2.3 million. Over the past five years since the last edition of *Knocking at the College Door* projections, student enrollment in public charter schools has grown by 70 percent. Elementary school students were the fastest category of enrollment growth. Because the increase in the number of charter school students (1.9 million) was larger than the increase in the number of traditional public school students (0.9 million), the percentage of public school students who attended charter schools increased from 0.7 to 4.6 percent during this period.⁹

And while the national average of 4.6 percent of enrollments at charter schools might not be enough to significantly impact national graduation trends, the trends in certain states and regions may be affected as the percentage of charter enrollments as a portion of all public school enrollments continues to grow. For example, in school year 2012-13, charter enrollments

represented more than 5 percent of total public school enrollments in 13 states.

- ▶ In 42 states and the District of Columbia, approximately 2.7 million students attended public charter schools – more than 5 percent of the total number enrolled in public schools.
- ▶ In 12 school districts, more than 30 percent of students attended charter schools. In nearly 150 districts, at least 10 percent of students attended charter schools.
- ▶ In 43 school districts, at least 20 percent of public school students were enrolled in charter schools in the 2013-14 school year.¹⁰

In 2012, Black students accounted for a higher percentage of enrollment in public charter schools (28 percent) than in traditional public schools (15 percent). Hispanic students also accounted for a higher percentage of enrollment in public charter schools (29 percent) than in traditional public schools (24 percent). The percentage of public charter school enrollees who were White (35 percent) was lower than the percentage of traditional public school enrollees who were White (52 percent). The percentage of Asian/Pacific Islander students enrolled in charter schools (4 percent) was also lower than the percentage enrolled in public schools (5 percent).¹¹

Homeschooled Students

Likewise, limited data are available about the homeschooled population, making it impossible to provide projections for this group of students. Despite these limitations, it is important to understand some general background about homeschooled students. They represented 3.4 percent of the school-age population (1.77 million students) in 2011, up slightly from 3.0 percent (1.52 million students) in 2007, and research indicates that family financial conditions may have contributed to further recent increases during the economic recession and recovery.¹² It is generally not possible to get state-level detail about the number of homeschooled students, nor to determine how many graduates were homeschooled.¹³

Immigration

Similar to the data limitations around charter- and homeschooled students, immigration presents substantial data-related challenges. Immigration – both authorized and unauthorized – has an important effect on population change, including births. With available data, it is simply not possible to pinpoint the exact contribution of immigration on the number of high school graduates. A few statistics about U.S. immigration trends, however, are helpful for understanding the relationship (and to some extent, the magnitude) of immigration to population growth overall and among youth in particular. The key takeaway is that higher immigration in previous years probably added more to the youth population in previous editions' projections than is likely for most of the years covered by the current edition.

In 2014, immigrants – including those who came to the U.S. or who were born here to foreign-born parents – represented 13.6 percent of the U.S. population (of which unauthorized immigrants were estimated to represent about 3.5 percent of the overall population and a quarter of the foreign-born population).¹⁴ The Pew Research Center estimates that immigrants contributed fully half of the nation's population increase between 1965 and 2015 (a total of 72 million people).¹⁵

Between 1990 and 2014, non-native youth aged 19 and under represented 4 to 5 percent of all children aged 19 and under (not including U.S.-born children born to non-native parents), but their share relative to U.S.-born children under age 19 has decreased since 2000.¹⁶ Also, recent immigrants have higher fertility rates than the U.S.-born population.¹⁷ Furthermore, the ratio of births to first graders six years later in the U.S. indicates a potentially dramatic decrease in net in-migration over the past five years. Between 2000 and 2008, the number of first graders exceeded the number of births six years previously by 3 percent. After 2010, however, it appears that fewer students enrolled in first grade than had been born six years previously. This is to be expected given factors such as childhood mortality (which is relatively steady at 0.7 percent nationwide), homeschooling, and an increase in the number of younger students who opt to defer

enrollment by one year. But this decrease in births-to-first grade progression is likely reflective of recent declines in immigration.

Most immigrants are Hispanic, but they are not a homogeneous category. Nationally, 64 percent of the Hispanic population is of Mexican origin, and almost 10 percent are of Puerto Rican origin. Individuals of these largest portions of the Hispanic population tend to be younger. And the share of all Hispanics that are foreign-born has fallen from about 40 percent in 2000 to 35 percent in 2014 (of these, 33 percent and 2 percent of Hispanics are of Mexican and Puerto Rican origin, respectively).¹⁸ The number of Mexican immigrants alone has totaled about 40 million since the 1970s (not including children born here). After that, the trend of Mexican immigration halted and then reversed. About 3 million Mexicans were estimated to have migrated to the U.S. between 2000-05, about 1.4 million between 2005-10, and about 870,000 between 2009-14 – a five-year period during which more than 1 million returned to Mexico,

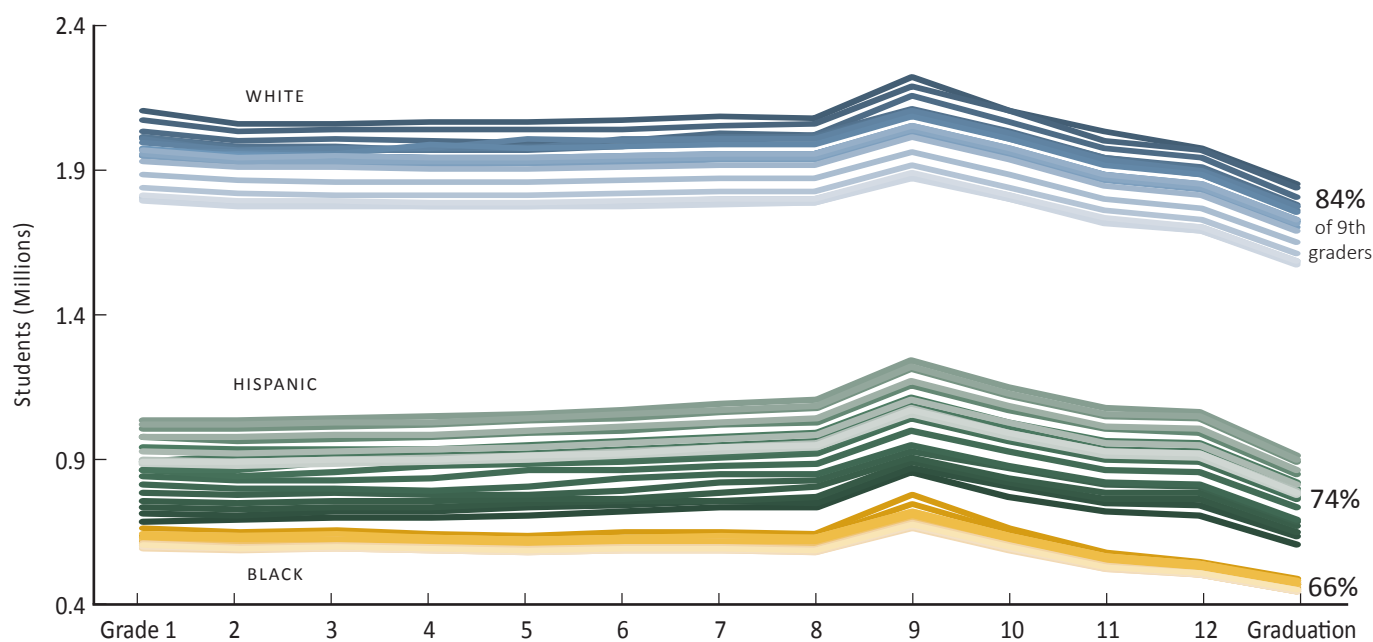

resulting in fewer Mexicans coming to the U.S. than leaving during roughly the same years that the number of births was in decline.¹⁹ During that same time, Asian immigration increased and is expected to be a primary factor in population growth, albeit in smaller numbers.²⁰

Clearly, non-native populations have been important factors in the overall size and profile of the U.S. population and school-age youth, and will be increasingly important as the number of White students continues to decline.

Enrollments Data Describe Untapped Opportunity

The enrollments data also reveal gaps in academic progress between different student populations as well as the populations that could yield the largest number of additional students – and, ultimately, high school graduates – if those gaps were narrowed. This kind of information is particularly important because the number of high school graduates has reached

Figure 4.4. Progression of Students Through the Grades, by Race/Ethnicity, School Years 2000-01 to 2020-21 (Projected)

Notes:

Earlier starting years shown as **DARKER** lines (e.g., 1st graders in 2000-01 to 2009-10). Later starting years shown as **LIGHTER** lines (e.g., 1st graders in 2010-11 to 2020-21). Each line represents the count of students beginning in Grade 1 and in each successive grade year-over-year, to Grade 12 and then graduate counts. Twenty years, i.e., starting “cohorts,” are shown for each race/ethnicity. American Indian/Alaska Native not included due to reasons of scale.

a plateau. There are simply fewer youth overall, so progress must be made in moving more of them successfully through the grades.

There are limits to the conclusions that can be drawn from these data, however. WICHE does not have data for predefined cohorts of students tracked over time, such as what the states now uniformly report on.²¹ As noted earlier, although it is possible to observe the percentage of students in one grade compared to the number in the prior grade a year earlier, movement in and out of the grades over the course of a year can affect that number. This is certainly a bigger consideration at a school district level, but student movement in and out of state or between public and private schools, as well as other movements, can reduce or add to the number of students in a given year. For that reason, WICHE only looks at progression at the national level, where in- or out-migration is not likely to a primary factor. Another mitigating factor with these data is that WICHE uses data for all high school graduates (regular diploma recipients) in a given year, so the number could include graduates who were not 12th grade students in that year. And some students might not graduate in one year from the 12th grade, but might go on to graduate in a later year.

Figure 4.4 displays an approximate “cohort” (or count) of first graders in a start year and the number of children who progress to the next grade, year-over-year, until that same approximate cohort of first-graders would theoretically reach graduation approximately 11 years later. The rates of progression from one grade to the next are relatively similar in the earlier grades up through eighth grade, and then there is a noticeable uptick between the eighth and ninth grades. This is generally considered to be due to several factors that cannot be precisely quantified.²² Other data show relatively high rates of retention for ninth graders. The other factor is the movement between private and public schools at certain junctures. For example, there is a slight decrease in the number of private school eighth graders compared to private school ninth graders, suggesting that many private middle school students attend public high schools.

Figure 4.4 illustrates that, on average, about 84 percent of White public school ninth graders are counted in the cohort of public high school graduates four years later. The corresponding rate for Hispanic public high school students is 74 percent, and for Black public high school students it is 66 percent. It bears repeating that there are limitations to the conclusiveness of these data, but it is difficult to ignore the differences between the high school populations by race/ethnicity.²³ On average, nationally, between 11 to 12 percent fewer non-White public school ninth graders appear to be making it to graduation compared to White public school ninth graders (non-White includes Black, Hispanic, American Indian/Alaska Native, and Asian/Pacific Islander).

Enrollment Projections Summary

A key message from the projections is that not only is the number of high school graduates declining, but also that the youth population is rapidly becoming majority non-White. The workforce of the 2030s will be determined over the course of the next 15 years by the youth who are entering school today. The data used in these projections indicate that fewer young adults will be entering the workforce overall over the next 15 years, and an increasing number of them will be individuals of color, but that there might be even more if differences in progression through the educational pipeline between populations were narrowed.

Endnotes

It Depends," Washington, D.C.: Pew Research Center, February 24, 2015, accessed October 6, 2016, www.pewresearch.org/fact-tank/2015/02/24/is-u-s-fertility-at-an-all-time-low-it-depends/.

² WICHE began reporting about the impending reduction in White high school graduates in the 1998 edition of *Knocking at the College Door: Projections of High School Graduates by State and Race/Ethnicity 1996-2012*. Other demographic centers report about Whites becoming the minority in the general population around 2050, but younger age groups becoming White non-majority in earlier years.

³ Ibid, Population Reference Bureau.

⁴ Births are categorized by the race/ethnicity of the mother. For simplicity, WICHE uses the mother's race/ethnicity interchangeably with the infant's race/ethnicity. However, some infants might be categorized differently in other data which capture the combined race/ethnicity of the mother and father. See Appendix C for more detail.

⁵ The federal Common Core of Data data that WICHE uses for these projections do not encompass students in Bureau of Indian Education (BIE) schools. The data indicate that students enrolled in BIE and tribally-operated schools educate between 8 to 10 percent of all American Indian/Alaska Native youth, about 40,000 student within 183 schools in 23 states. In school year 2012-13, the states with the highest number of schools serving 70 percent of BIE-educated youth nationally, were Arizona, New Mexico, South Dakota, and North Dakota. Other states in which American Indian/Alaska Native individuals are most highly concentrated are Oklahoma, California, and Alaska, but it appears most of these students are included in the public schools data. WICHE was unable to obtain the necessary data to add these students to the projections.

⁶ Center for Public Education, "School Choice: What the Research Says," National School Boards Association: Alexandria, VA, 2015, accessed March 30, 2016, www.centerforpubliceducation.org/schoolchoice. While still a relatively small percent of all enrollments, recent data suggest growth in the numbers of students enrolled with full-time virtual schools. These students should be reflected in the public total, but to the extent that these students experience different outcomes, they could have an effect on graduation counts that may differ from the overall trend among public school students. CHAPTER 5. IMPLICATIONS

The projections presented in this edition of *Knocking at the College Door* tell a different story from years past. After about 15 years of steady increases between 1996 and 2013, the total number of high school graduates is projected to reach a plateau. No longer will state and postsecondary institutional leaders be able to count on a steadily increasing stream of high school graduates knocking at their door. And, beyond 2026, U.S. colleges can expect an overall decline in the number of high school graduates. As discussed at length in Chapter 3, the national numbers certainly mask regional and state variation. Specifically, there will be growth in the South and West and continued declines in the Midwest and Northeast. Underlying these trends is increasing diversification of the high school graduating classes fueled in part by declines in the numbers of White students. If one thinks about these changing demographics in the context of the education pipeline, the policy and practice implications are varied and potentially impactful.

Policy Questions and Implications

A variety of public policy questions and implications arise from an examination of these data; how the policy issues are framed depends on one's perspective. For instance, a state legislator from a state with projected declines in high school graduates will likely see a policy challenge to solve and a solution that involves identifying ways to fill seats on college campuses. A state legislator from a state with projected increases, on the other hand, has the exact opposite challenge in mind. How will the state deal with too much demand and not enough capacity to serve its students, particularly when the available resources are limited? Another example might be an enrollment manager at a college campus with moderately selective admissions in a state with projected declines in enrollments. In order to build a freshmen class that will succeed at her institution, she will have to decide which students to recruit and from where. These are just a few on-the-ground examples of the immediate issues that arise when considering the effects of the projected demographic changes.

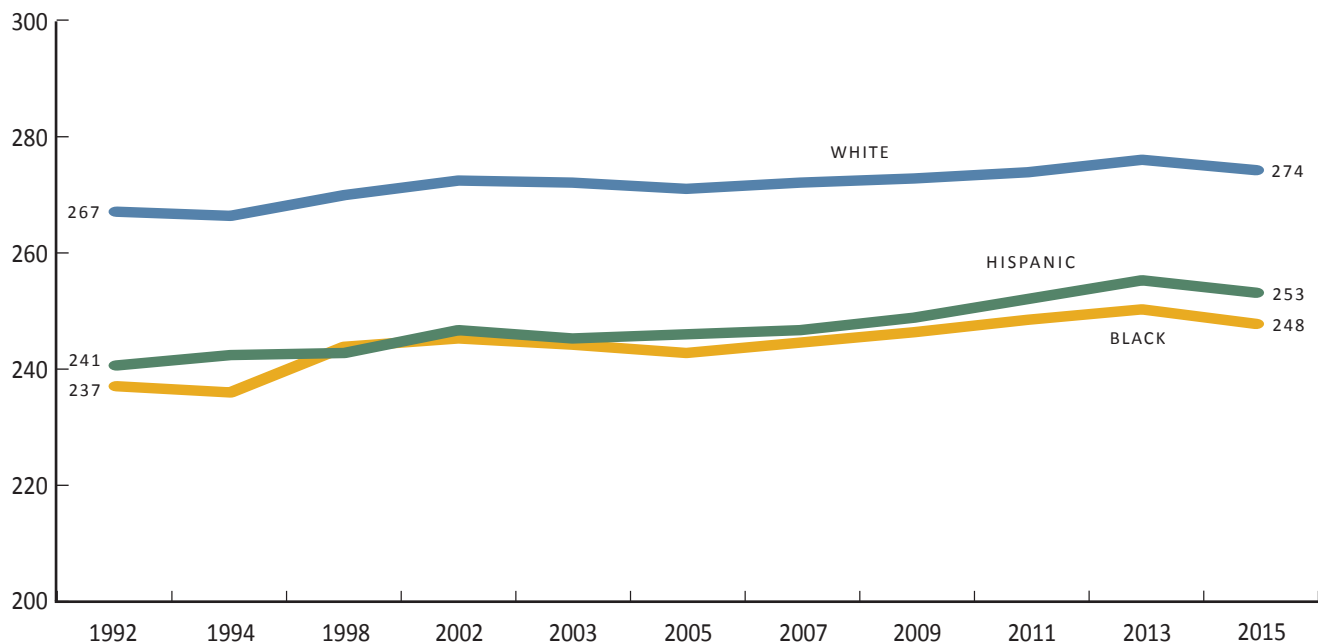

Figure 5.1. National Assessment of Educational Progress Scores in Math for 8th Graders, 1992-2015

Note: Black includes African American, Hispanic includes Latino, and Pacific Islander includes Native Hawai'ian. Race categories exclude Hispanic origin. Prior to 2011, students in the "two or more races" category were categorized as "unclassified." The NAEP Mathematics scale ranges from 0 to 500. Some apparent differences between estimates may not be statistically significant.

But there are also long-term considerations related to the entire educational pathway as well.

Achievement Gap in K-12

When people speak about the achievement gap in K-12 education, they are generally referring to the variations in academic performance between different populations of students. In the United States, the differences are revealed most starkly by race/ethnicity. For example, Whites consistently outperform students of color in both math and reading among eighth graders (see Figures 5.1 and 5.2).¹ And although some progress has been made to close the achievement gaps between students of color and White students that have been prevalent since the 1970s, disparities remain.²

The *Knocking at the College Door* projections of high school graduates as well as high school enrollments suggest a diversification of student populations, with fewer White students and increasing numbers of non-White students. Despite some progress in efforts to close the achievement gaps between these groups of students, if these trends continue the outlook for overall student performance may be in question.

Recent state policy changes, such as the implementation of the Common Core State Standards (CCSS), are intended to have a positive impact on the academic performance of all students. However, the CCSS has been a politically charged issue that has created, and will continue to create, challenges for assessing the true impact of this major policy change on student academic performance overall, as well as identifying whether they have been effective for all students and not just those who have historically performed well academically. The first CCSS-aligned examinations were given in Spring 2015; however, the decision by states to adopt various tests has induced variability that complicates the evaluation even further. For example, some states have adopted the Smarter Balanced Assessment while others have joined the Partnership for Assessment of Readiness for College and Careers (PARCC). Some states have aligned with ACT or The College Board or developed their own assessment. This variation makes comparison across states challenging at best. Over time, an examination of other indicators such as the National Assessment of Educational Progress (NAEP) can help to assess the impact of these new standards on student academic performance, specifically with respect to certain subpopulations.

Adoption and implementation of the standards on their own, however, will not lead to improvements. It is what happens on the ground that will impact students the most. The policy and practice decisions that district and school administrators make, as well as the support they give to the teachers who interact with the students every day, are critical to the success of the standards. The amount of actionable data that are now available about these standards and assessments is unprecedented. If educators can develop the skills necessary to understand and use the data from the assessments – and if schools and districts can provide them with the support they need to develop those skills – they will be better able to make informed decisions about how to more effectively support their students.

There are myriad policy efforts around the country that are designed to close the achievement gaps in K-12 education, and they are not all focused solely on the academic aspects of a child's life. Many of the children in student populations that perform less well than the average are also from low-income backgrounds, and comprehensive efforts aimed at supporting those children are underway in many areas. Stakeholders should consider undertaking additional evaluations of the impact that those policies and programs are having and the ways they interact with the academic initiatives, as well as consider ways of scaling them up in a concerted effort.

Reaching the Goals

In the past decade, various entities have established postsecondary attainment goals designed to spur policymakers and higher education leaders to action. In an address to a Joint Session of Congress in 2009, President Barack Obama established a national postsecondary attainment goal whereby the nation would achieve the highest proportion of college graduates in the world by 2020.³ Lumina Foundation has been working toward Goal 2025, which aims to have 60 percent of Americans holding degrees, certificates, or other high-quality postsecondary credentials by 2025.⁴ Likewise, as of September 2016, governors, legislatures, or college or university systems in at least 29 states had set postsecondary attainment goals for their students.⁵ When these goals

are developed in ways that lead to policymakers and stakeholders believing that they are legitimate and worthwhile, then policymakers and stakeholders will work toward them. When designed well, these goals also provide a common purpose by which people at all levels can make decisions. For instance, in November 2013, the Washington Student Achievement Council (WASC), that was subsequently adopted by the Washington State Legislature, adopted the 2013 Roadmap report that set two aggressive state educational attainment goals to be achieved by 2023:

- ▶ All adults in Washington, ages 25-44, will have a high school diploma or equivalent.
- ▶ At least 70 percent of Washington adults, ages 25-44, will have a postsecondary credential.⁶

To accomplish these goals, WSAC identified strategies focused on three primary objectives: ensuring access, ensuring learning, and preparing for future challenges.⁷ WSAC adopted an update to the 2013 Roadmap in December 2015.⁸ The 2015 Update, which was the first progress report since the initial adoption, showed progress on three key measures: high school completion, postsecondary enrollment, and postsecondary completion.⁹ Although the state is only just beginning to monitor progress toward its goals, the Roadmap has defined how the state views and advances its higher education agenda. For instance, Washington is now preparing to release its 2017-19 strategic plan to advance educational attainment, and cites *Knocking at the College Door* data that show increasing diversification in the state of Washington. Importantly, the plan highlights the need to serve underrepresented students if the state is to meet its established goals in the near future.¹⁰

In addition to the projected plateau in the number of high school graduates, the United States has been facing steadily declining enrollments in all sectors for students over the age of 24.¹¹ This creates additional challenges; with fewer students in the traditional pipeline and fewer adults returning to postsecondary education recently, policymakers who want to reach the national and state postsecondary attainment goals will need to consider how to more effectively serve populations that have not been served well

historically.¹² To begin, they need to use data to evaluate the impact of policies, particularly when resources are limited. Then, as they identify effective policies, they must invest in scaling up those that work.

Postsecondary institutions also feel the combined effects of the projected plateau in the number of traditional-age students in the pipeline and a decline in adult student enrollments. While there is variation at the regional and state levels, overall such an environment can create increased competition for students within and across state borders, forcing enrollment managers and others not just to find new ways to recruit students, but also to identify new categories of students to recruit in the first place.

Attainment Gap in Postsecondary Education

State postsecondary attainment goals are often set by looking at data that indicate projected employment needs, which is a key consideration for governors, state legislators, and others who are interested in creating and maintaining a robust economy with a skilled workforce. Far fewer states, however, have explicitly included in their goals any language about closing attainment gaps for underserved students despite data that clearly show changes in demographics around the nation. The achievement gaps seen in K-12 education are also reflected in postsecondary education; Asian and White students have higher postsecondary attainment levels than Black, American Indian/Alaska Native, and Hispanic adults (see Figure 5.3).

Colorado is an example of a state that is taking the lead in focusing its attention on closing its attainment gap. State policymakers have recognized that despite overall high postsecondary education attainment levels, certain troubling trends persist. Students of color enroll in college at lower rates than White students, they do not perform as well, and they graduate at lower rates. In response, and with the support of Governor John Hickenlooper, the Colorado Department of Higher Education (CDHE) has set as its primary strategic policy initiative closing the attainment gap by half by 2025. For the past year, CDHE has been establishing strategies, setting targets, and monitoring progress toward this goal. This specific attention to the state's attainment gap is the guide by

Figure 5.3. Postsecondary Educational Attainment Level, Associate's Degree and Above, by Race/Ethnicity, Adults aged 25-64 (2014)

Source: U.S. Census Bureau, 2012, 2013, and 2014 American Community Survey One-Year PUMS Files.

which the department does much of its work and that helps staff stay on target.

Going forward, particularly in light of these projections suggesting rapid diversification in the traditional-education pipeline, those states that are serious about reaching their attainment goals will soon likely need to consider establishing a set of related goals that address attainment gaps. Without specific attention paid to this issue, states are not likely to prioritize it even when the data may clearly show unprecedented changes in demographics at their doorstep.

Connections to the Workforce

Finally, the gaps that persist in K-12 and in higher education will ultimately manifest in the workforce. Data show that 65 percent of jobs will require some sort of training beyond high school by 2020.¹³ Until American Indian/Alaska Native, Hispanic, and Black students are achieving the same levels of degree attainment that Asian and White students are, they will not be able to fully participate in and benefit from the expanding global economy.

As an example, students of color have fallen behind particularly in STEM (science, technology, engineering, and mathematics) occupations.¹⁴ While underserved students (including African American, American Indian/

Alaska Native, Hispanic/Latino, or Native Hawaiian/ other Pacific Islander; low-income; or first generation in college) make up a large portion of potential STEM students, they are far less prepared for success in STEM coursework in college as measured by the ACT College Readiness Benchmark in science.¹⁵ While this is not to suggest that all students need to pursue STEM degrees in order to succeed in the workforce, careers in STEM fields are often higher paying, are increasingly in demand, and are connected to the country's economic competitiveness and innovation.¹⁶

Another example that affects students throughout the education pipeline is the diversity of the educator workforce. Despite evidence suggesting that racial diversity among teachers can benefit students, 82 percent of public school teachers in the 2011-12 school year identified as White, a figure that has not changed much in the past 15 years.¹⁷ The racial/ethnic composition of the leadership at schools looks much the same. In the 2011-12 school year, about 80 percent of public school principals were White, compared to only 10 percent who were Black, and 7 percent who were Hispanic.¹⁸ Yet, the racial/ethnic composition of the students they serve has shifted. The projections presented in this edition of *Knocking at the College Door* confirm this diversification will continue and amplify into the future. As discussed in Chapter 2, the projected increases in the number of non-White public high school graduates could replace the decline in the number of White high school graduates (public and private combined) almost one-to-one in a number of years.

As the composition of high school graduating classes becomes more diverse, targeted policy efforts designed to increase success among non-White student populations will be necessary to maintain the levels of postsecondary education attainment that the U.S. has historically experienced, not to mention the economic standard of living that is underpinned by high levels of educational attainment. Not only will the number of White students – who have historically performed better – simply not be in the pipeline as they have been at previous points, there is a societal obligation as well as an economic imperative to serve all of the youth of this country so they can succeed in school and in the workforce.

Implications Summary

In the context of the changing demographics presented in *Knocking at the College Door*, policymakers and stakeholders have some important policy decisions to make. As education professionals, policy leaders, researchers, community leaders, or parents, we can choose to focus on the challenges or view this as an opportunity. The education landscape looked very different 40 years ago than it does today, and it will look very different 40 years from now. How we want our education system, our society, and country to look is up to us. WICHE encourages everyone with a stake in education to take these data as they are presented here and use them in ways that make our schools, districts, universities, colleges, states, and country places with more high-quality educational opportunities for all students.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking.

Notes: See Figure 3.1. Regional Divisions of the U.S. on page 19 for the states covered by this region. School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

SOUTH

- 1,267,800 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 11.0% between 2011-12 and 2024-25, the next highest year for the South.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see [Appendix C: Technical Information and Methodology at www.wiche.edu/knocking](#). Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

CONNECTICUT

- 38,500 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates in Connecticut is not projected to increase after 2011-12, ending at 33,000 in 2031-32.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

FLORIDA

- 4th highest producer of high school graduates with 178,700 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 13.2% between 2011-12 and 2024-25, the next highest year for Florida.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

ILLINOIS

- 5th highest producer of high school graduates with 140,000 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates in Illinois is not projected to increase after 2011-12, ending at 124,600 in 2031-32.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

KANSAS

- 35,600 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 10.7% between 2011-12 and 2024-25, the next highest year for Kansas.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see [Appendix C: Technical Information and Methodology at www.wiche.edu/knocking](http://www.wiche.edu/knocking). Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see [Appendix C: Technical Information and Methodology at www.wiche.edu/knocking](http://www.wiche.edu/knocking). Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

MINNESOTA

- 62,700 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 7.8% between 2011-12 and 2024-25, the next highest year for Minnesota.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

NORTH CAROLINA

- 10th highest producer of high school graduates with 103,600 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 10.3% between 2011-12 and 2025-26, the next highest year for North Carolina.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

OREGON

- 36,500 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 2.7% between 2011-12 and 2025-26, the next highest year for Oregon.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see [Appendix C: Technical Information and Methodology at www.wiche.edu/knocking](https://www.wiche.edu/knocking).

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see *Appendix C: Technical Information and Methodology* at www.wiche.edu/knocking. Source: Western Interstate Commission for Higher Education, *Knocking at the College Door: Projections of High School Graduates*, 2016.

WASHINGTON

- 71,800 high school graduates, on average, projected per year between school years 2011-12 and 2031-32.
- The total number of graduates is projected to increase by 10.6% between 2011-12 and 2025-26, the next highest year for Washington.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see *Appendix C: Technical Information and Methodology* at www.wiche.edu/knocking.

Notes: School Year refers to the K-12 calendar running fall to spring and may include graduates from any point in that school year, including the summer after the year end. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2011-12. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: Technical Information and Methodology at www.wiche.edu/knocking. Notes: School Year refers to the K-12 calendar running fall to spring. High School Enrollments include grades 9 to 12. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2012-13. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see *Appendix C: Technical Information and Methodology* at www.wiche.edu/knocking.

Notes: See Figure 3.1. *Regional Divisions of the U.S.* on page 19 for the states covered by this region. School Year refers to the K-12 calendar running fall to spring. High School Enrollments include grades 9 to 12. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2012-13. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: *Technical Information and Methodology* at www.wiche.edu/knocking.

Notes: See Figure 3.1. *Regional Divisions of the U.S.* on page 19 for the states covered by this region. School Year refers to the K-12 calendar running fall to spring. High School Enrollments include grades 9 to 12. The Grand Total is the sum of the Private Schools and Public Schools totals. The Private Schools Total includes schools not supported primarily by public funds, religious and nonsectarian, but not including homeschool students. Private Schools projections begin in school year 2012-13. The Public Schools Total will not exactly equal the sum of the races/ethnicities columns, which are projected separately. Prior to 2010-11, data were not available separately for Asian and Pacific Islander students, and Two or More Races students. Hawai'ian/Pacific Islander and Two or More Races counts are displayed separately in the years they were reported for informational purposes, but are included in the race categories in the projected years. For more detailed information, see Appendix C: *Technical Information and Methodology* at www.wiche.edu/knocking.

APPENDIX C

TECHNICAL INFORMATION AND METHODOLOGY

APPENDIX C. TECHNICAL INFORMATION AND METHODOLOGY

Underlying assumptions and data constraints are inherent in any projections and must be understood in order to determine the appropriate uses and interpretations of the projections. The historical reported counts and projections of high school graduates used in this edition of *Knocking at the College Door* rely on several types of data accumulated over many years and span roughly three decades, from 2000 to 2031. The projections therefore reflect myriad past, current, and projected future trends in economics, demographics, education, and even data collection. Because the projections of high school graduates are estimates of future trends based on past observed trends, unforeseen factors will undoubtedly affect actual outcomes over the 17-year span of the projections.

The sections below provide an overview of the projection methodology, influential factors that are implicitly modeled in the projections, and pertinent information relating to the data underlying the projections. In many cases, technical aspects of the projections are discussed in light of specific examples.

Methodology Overview

WICHE's *Knocking at the College Door* projections of high school graduates are produced using a methodology known as the cohort survival ratio (CSR) method, which is essentially an observation of the progression of students/individuals from birth to first grade, through each grade, and from the 12th grade to graduation. WICHE uses these ratios, calculated from all available data, to project the number of enrollments and graduates in the years to come. WICHE uses a five-year smoothed average ratio for making the projections, in order to place relatively greater weight on the most recent year's data without masking or eliminating any trends that would be evident by taking a longer view. Each cohort survival ratio is calculated as:

$$Y_{pt} = wY_{p(t-1)} + (1-w) \frac{\sum_{i=2}^5 Y_{p(t-i)}}{4},$$

where Y_{pt} is the CSR at a given progression point p in year t , and w is the smoothing weight (equal to 0.4 in the first year and .15 for each of the four prior years in WICHE's methodology).

In simple terms:

- ▶ The CSR methodology operates by calculating the difference between the **enrollments** in a given grade in one school year and the enrollments in the subsequent grade level the next year. For example, if there are 100 first graders in school year 2012-13 and 98 second graders in 2013-14, the ratio of first graders to second graders is 0.98. (Although the focus of this publication is on high school graduates, the CSR methodology thereby also produces grade-level enrollment projections.)
- ▶ WICHE uses data on **births** from the National Center for Health Statistics (NCHS) to derive the ratio of the number of children born in a given year compared to the number of first graders reported approximately six years later.
- ▶ The ratio of 12th graders to graduates indicates the ratio between the reported count of 12th graders in a school year to the number of high school **graduates** (which encompasses all graduates throughout the school year, but largely reflects those who graduate in the spring term).

The last year for which graduates can be projected is 17-18 years past the last available year of births data, which is approximately when the most recently born children would be graduating from high school.

WICHE uses the CSR methodology for reasons that are similar to why educational planners in schools, school districts, states, and the federal government use it – because its relative simplicity and transparency meet the wide-ranging needs of its users. But perhaps an even greater strength of this methodology is that only a limited amount of data are required. Also, despite the relative simplicity of the CSR methodology, studies have shown that it is reasonably accurate for short-term projections and even for small populations.¹ While alternative methodologies exist that provide short-term projections that are as accurate as

CSR, this equivalence is offset by the fact that the alternative methodologies have more extensive data requirements and employ techniques that are far less easily understood by non-statisticians.

Historical Accuracy

WICHE makes all reasonable effort to ensure that the *Knocking at the College Door* methodology remains a credible and reliable method for producing these projections. This includes consulting with experts for each edition, assessing the accuracy of the projections against the subsequently reported actual data and other education projections, and carefully inspecting the underlying data and other pertinent information (discussed throughout Appendix C). Furthermore, WICHE releases updated projections every four to five years on average. This is a relatively short period of time considering that student populations and trends are relatively stable and the projections are therefore reliably contemporaneous.

Ongoing Expert Review

In preparation for the 2012 edition of *Knocking at the College Door*, WICHE undertook a comprehensive methodological review. It commissioned a technical white paper, convened both a technical review panel of experts and an end-user panel of various experts who use *Knocking at the College Door*, and conducted a simulations analysis to compare the relative accuracy of several CSR alternatives.² The report of WICHE's recent methodology review provides a thorough discussion of the methodological considerations, alternatives, and results of the expert panels and simulations analysis.³ In summary, the CSR methodology was found to produce projections as well as or better than the two most feasible alternatives (single and double exponential smoothing), to accommodate the constraints of the available data, and to provide the transparency and understandability that give the projections their substantial credibility.⁴

For this edition of *Knocking at the College Door*, another full methodological review was not necessary, but WICHE convened an advisory group of experts and users to provide guidance on methodological issues and to review the preliminary projections. The members of the advisory group were:

Patricia Barth, director, Center for Public Education, National School Boards Association (NSBA)

Jack Buckley, senior vice president, research, The College Board

Emily Calderon Galdeano, senior associate, Excelencia in Education

Andrew Carlson, senior policy analyst, State Higher Education Executive Officers Association (SHEEO)

Matthew Crellin, senior associate, National Center for Higher Education Management Systems (NCHEMS)

Will Doyle, associate professor, Vanderbilt University

Nate Easley, executive director, Denver Scholarship Foundation

Steve Kappler, vice president, brand experience, ACT

Jeffrey Passel, senior demographer, Pew Research Center

Kent Rinehart, assistant vice president of enrollment management/dean of admission, Marist College

José Rios, director, multicultural communications, The College Board

David Sanders, research director, American Indian College Fund

Brian Sponsler, director, Postsecondary Institute, Education Commission of the States (ECS)

Jeff Strohl, director of research, Georgetown University Center on Education and the Workforce

Christina Whitfield, associate vice president, State Higher Education Executive Officers Association (SHEEO)

Comparison to Other Education Data

WICHE periodically compares the *Knocking at the College Door* projections to other data about high school graduates to better gauge their accuracy in real-time and over past editions. Analysis of past projections provides WICHE with greater confidence in its predictions of overall numbers as well as of particular trends. On average, WICHE's projections of the total number of public high school graduates in the United States from the 2003, 2008, and 2012 editions of *Knocking at the College Door* are within 2 to 3 percent of the actual numbers subsequently reported to the National Center for Education Statistics (NCES) Common Core of Data (CCD) for specific years within the first four years of the projections (Table C.1). The average gap for the statewide total public graduates is similarly low. There is greater variance for some

Table C.1. Percent Difference of Projected Total Graduates Compared to Graduates Reported to NCES CCD

2003 edition	2002-03	2003-04	2004-05	2005-06

regions and in other lower-level groupings such as by race/ethnicity, but it does not appear to be systemic. The possible reasons for variance are discussed throughout this section.

The 2012 edition of the *Knocking at the College Door* projections appear to have been particularly affected by unexpected/unforeseen increases in the number of high school students and graduates that were subsequently reported in the data used for these projections (see the sidebar in Chapter 2). California, in particular, reported higher numbers in recent years, while other states reported differences between the 2008-09 data and subsequent years, though these increases were not as high as that reported by California.⁵ While it is not possible to identify the precise sources of this unexpected increase,

WICHE's research indicates that it might have been a result of several factors including Deferred Action for Childhood Arrivals (DACA), an increase in the number of students who remained in high school during the Great Recession and the subsequent slow economic recovery, real increases in the number of students progressing to graduation, and the use of improved student-data systems, among other reasons. As explained previously, however, the last year of reported data had the greatest influence on the projections, especially in the short term, and it appears that the significant increases that were represented in data released since the 2012 edition introduced slightly greater short-term variance between the projections and subsequently reported data than in previous editions.

NCES also produces projections of high school graduates, the most recent edition of which contains projections through school year 2023-24 for the nation by race/ethnicity, by state totals, and by the number of national private school graduates.⁶ NCES updates these projections annually, and WICHE's projections have typically been within 2 percent of these projections. WICHE compared the 2012 *Knocking at the College Door* projections to each of the three editions of NCES projections released since (Figure C.1). The figure shows the *Knocking at the College Door* projections made in 2012, for which 2008-09 was the last year of available data and therefore served as the starting point for the projections, compared with the projections in this edition, which used 2012-13 data as the starting point. Figure C.1 also shows how the starting point of the NCES projections have been adjusted with each year's subsequently released data, and as a result the following years were slightly different. This result illustrates and reiterates how influential the data from the most recent year are to subsequent projections. It also shows how relatively close all of the projections series are to each other, in that each series contains a predicted "dip" (as yet not shown in the reported data), and that they all follow a similar trend through the early 2020s.

Figure C.1. Comparison of *Knocking* and NCES Projections, United States Public Schools Total

Expected Differences between National, Regional, and Subgroup Projections

WICHE develops its national and regional projections independently of its state projections. The state projections do not equal exactly to the regional projections, nor do the state and regional projections sum exactly to the national projections. Similarly, projections are developed independently for each racial/ethnic population by state, and those projections do not sum to the regional or national total public projections. The small numerical differences that result from making these projections independently may cause confusion for some *Knocking at the College Door* users. For example, the sum of WICHE's state projections was about 11,000 (less than 1 percent) greater than that of the independent projection for the United States for 2027-28, which was the last year of projections for the 2012 edition of *Knocking at the College Door*.

During its methodology review for the 2012 edition of *Knocking at the College Door*, WICHE sought consultation on the merits and alternatives to making the lower-level projections independent of the aggregate projections. WICHE continues to make independent projections for each racial/ethnic group in each state, in part because the smaller counts of some population groups lead to greater uncertainty

in the projections, and also because some legitimate growth trends that are seen at the lower levels might be overstated or understated if they were adjusted.

The 2012 edition of *Knocking at the College Door* featured relatively small differences between the independent sets of projections. There was a difference of 1 percent or less in any of the projected years between the sum of lower-level projections and the aggregate higher-level projections, for any combination, except for the following:

- ▶ A difference of 2.5 percent or less in any of the projected years between the sum of the regions and the independently projected national total for Hispanic and Asian graduates.
- ▶ A difference of 5 percent or less in any of the projected years between the sum of the regions and the independently projected national total for American Indian/Alaska Native graduates.
- ▶ A difference of only about 1 percent, on average, between the sum of race/ethnicity projections and the public total projection, across all states and years and within any region; the average difference across all years for any given state was +/-2.5 percent.

Generally speaking, the differences between the independently projected series tend to increase in later future years, consistent with the nature of extended projections. The greatest differences in terms of percentage show up in the two categories with the smallest counts: in the number of nonpublic and American Indian/Alaskan Native graduates, and in the Northeast, the region with the lowest number of graduates.

Approach to Limitations with Available Data

All public school data were obtained from the CCD, maintained by NCES, part of the U.S. Department of Education. At the time of publication, the most recent available CCD data were for enrollments through school year 2013-14 and graduates through 2012-13. To obtain private school data, WICHE relied on the Private School Universe Survey (PSS), a biannual survey conducted in odd years by NCES that provides data for religious and nonsectarian private/nonpublic elementary and secondary schools in all 50 states and the District of Columbia. In producing this edition of the *Knocking at the College Door* projections, WICHE encountered two major dilemmas resulting from data limitations that impacted its efforts to produce the most useful, relevant projections possible:

- ▶ A lack of more recent data, or “data lags,” that made it impossible to make projections that began closer in time to the data of publication.
- ▶ A lack of sufficient data that would allow WICHE to make projections for the new race categorizations.

This section outlines the data issues that impacted the production of these projections, the analysis and efforts undertaken to address the data limitations, and the decisions that led to what is included in this edition. WICHE presented these issues and analysis to the *Knocking at the College Door* Advisory Group on two occasions for their recommendations. In all cases, the foremost criterion was whether WICHE could produce reliable, transparent projections from the available data for the nation, region, and each state while also making them contemporary and relevant.

Lags in Available Data

This edition of *Knocking at the College Door* projections is being released approximately four years after the 2012 edition. WICHE has typically updated its projections every four to five years, while demand typically increases for updated projections about two years after the release. This edition is no exception; indeed, WICHE has experienced heightened demand for this update given the climate over the last several years as states continue to recover from the Great Recession and colleges struggle with enrollment declines, among other factors. WICHE selected December 2016 as the target to release the ninth edition of the *Knocking at the College Door* projections for a number of reasons, but primarily to make the projections available in time for the 2017 legislative cycle. It was apparent months in advance that there would be a dilemma in attempting to produce the most up-to-date projections possible despite delays in the availability of more recent data. The projections were not considered final until the last possible moment, in order to incorporate more recent data if they became available.⁷

Therefore, the first year of public high school graduate projections in this 2016 edition are for graduates of school year 2013-14 (Class of 2014), which is approximately two years earlier than this edition’s December 2016 publication date. The first year of public school grade-level enrollment projections are for school year 2014-15, which is also two years in the past. The private school projections begin two years prior to this, with private school graduate projections beginning school year 2011-12 (Class of 2012) and enrollment projections beginning 2012-13, due to lags in the biennial Private School Survey data.

Of course, these issues somewhat complicate a discussion of the projections and typically require the use of precise language and notation to differentiate between confirmed counts of students and graduates versus projections. Notwithstanding this less-than-ideal situation, several factors mitigate the impact and importance of past projections. First, an analysis of historical accuracy (see the section *Historical Accuracy*) provides users with a sense of how close the first several years of projections are compared to what is

subsequently reported in the data. For example, the first two to three years of *Knocking at the College Door* projections are typically within 1-2 percent of what is subsequently reported. Therefore, unless one needs to understand trends from these prior years, it is reasonable to move past the first several projected years (e.g., 2014-15 and 2015-16) and use the projections for current and subsequent years.

In early 2016, as it became clear that there might be lags in the CCD, WICHE began considering whether to incorporate data from the states. WICHE was sufficiently concerned that the projections would not capture recent, quantitatively substantial trends, especially because a similar situation had arisen with the 2012 projections (see the section *Historical Accuracy*). Therefore, WICHE conducted extensive data collection and analysis to produce a partial, simulated projection using data obtained from state departments of education. Through these efforts, WICHE compiled a somewhat more recent set of data for 22 states, which together generated at least 66 percent of the national total of public high school graduates. Enrollments and graduates through school year 2014-15 were available for most of these, at least for public school totals.

However, this approach did have inherent limitations. In many cases, full race/ethnicity details were not available. In other cases, the data were simply unavailable or infeasible to obtain. In still other cases, it was not possible for WICHE to reconcile anomalies or other data issues, which made the data insufficient for projection purposes. From this effort, it became apparent that it would not be feasible to produce the official projections from state data instead of the Common Core of Data. Table C.2 lists the states for which sufficient data were available to allow their use in the simulated projections.

WICHE used this accumulation of more recent state-sourced data for 22 states to simulate a projection of the public schools total beginning with school year 2015-16. This served as a comparison with the official, published projections based on the CCD data that begin with the Class of 2013-14. Figure C.2 shows how the two series of projections tracked each other and indicates the percent difference in each year between

Table C.2. States Included in the Simulated Comparison Projection (Percent of National Public Total Graduates and Number of Graduates)

California	13%	385K	Wisconsin	2%	65K
Texas	9%	273K	Tennessee	2%	60K
New York	6%	179K	Maryland	2%	58K
Florida	5%	153K	Colorado	2%	50K
Pennsylvania	4%	131K	Kentucky	1%	42K
Ohio	4%	122K	Kansas	1%	31K
Michigan	4%	115K	Utah	1%	31K
Georgia	3%	86K	Arkansas	1%	29K
North Carolina	3%	85K	Nebraska	1%	20K
Virginia	3%	80K	Hawai'i	0%	11K
Washington	2%	67K	Rhode Island	0%	10K

Note: WICHE prioritized data collection for the highest-producing states, but assessed data availability for all states. WICHE was not able to obtain data for Illinois (133,000 students), New Jersey (97,000), Massachusetts (64,000), Missouri (63,000), Indiana (63,000), Arizona (63,000), and Minnesota (60,000), plus the other 21 states that generated the remaining 15 percent of the national total.

the official published projections and the simulated projections based on more recent data for these 22 states. The two series of projections are within 1-2 percent of each other for the public total in each year.⁸ WICHE considered these results to be a reasonable indication that substantially better or more accurate projections would not have resulted had it waited on the availability of more recent data.

Insufficient Data to Produce Projections for All New Race/Ethnicity Categories

The second major dilemma that WICHE faced while producing this edition was the question of whether it would be possible to make projections in the seven expanded race/ethnicity categorizations that are now the (required) convention in most federal data sources. WICHE considered available options in detail, but ultimately determined that it would not be possible to make projections, let alone reliable projections, in the expanded race/ethnicity categories. There are two overarching reasons for this determination. First, at present the accumulation of reported actual births and school data is insufficient to produce the projections. Second, there are patterns in these accumulating data that are erratic and have yet to “settle out” under the new schema. As a result, WICHE deemed it inadvisable

Figure C.2. Partial Simulated Projections Compared to Official, Published Projections

to attempt to use these data to produce projections, even in the very few instances in which the data were close to sufficient.

Therefore, WICHE decided to continue providing projections using the five long-standing historical racial/ethnic categories. The reported actual counts of students in the additional race/ethnicity categories are published for informational purposes. This section provides some detail about what WICHE observed with the available data and offers insights and observations resulting from the close inspection of these data.

Overview of the Racial/Ethnic Category Changes (Public School Only)

Prior to 2008-09 NCES had asked states to report public school student enrollment and completion counts by the five long-standing racial/ethnic categories.⁹ Beginning with the 2010-11 school year, every state and jurisdiction was required to report its public school student counts to NCES using the expanded set of seven racial/ethnic categories established by the Office of Management and Budget (OMB) in 1997 for the collection and reporting of race/ethnicity in federal data. A small number of states began reporting in the new seven categories in school year 2008-09 or 2009-10, because their data systems allowed for it.

In simple terms, the expanded set of categories separated the distinct Hawai’ian/Pacific Islander student population from the previous Asian/Pacific Islander combined total, and also established a new category for Two or More Races. The Hispanic category also represents a slightly different categorization scheme, and the race categories are now “non-Hispanic” by definition. Figure C.3 illustrates the staggered implementation and provides a simplified view of the lack of necessary data for making projections for the new race categories. The shaded boxes indicate the number of states and years of data under the new reporting schema in the data used for this edition of the publication. The WICHE method relies on the availability of five years’ worth

Figure C.3. Availability of Data in New Race/Ethnicity Categories

of prior data, and few states had that many years' worth of data in the new categories and at all levels of detail. For most states, this lack of data was further compounded by insufficient data on births (as discussed in the section titled Methodology Considerations).

WICHE considered producing a truncated series of projections in the new categories for the few states that lacked necessary births data but had sufficient student data, but ultimately decided not to because of other data limitations discussed herein. WICHE also considered using alternative data to estimate or serve as proxies for the missing data, but this introduced other data disadvantages and complexities that would have required WICHE to abandon its relatively straightforward and transparent methodology or use of data that have proven suitable for multiple editions.

While the data for students in the Two or More Races and Hawai'ian/Pacific Islander categories were insufficient to produce reliable, plausible projections, the counts of these students are used in making the projections:

Hawai'ian/Pacific Islander. Hawai'ian/Pacific Islander student counts were added to those reported in the Asian category, prior to distributing the Two or More Races counts as described below. In the published data, the Asian/Pacific Islander combined total count includes students categorized as Asians and Hawai'ian/Pacific Islanders reported separately in all years. The separately reported Hawai'ian/Pacific Islander counts are shown for informational purposes.

Two or More Races. WICHE was unable to locate sufficient information to devise a method for distributing the reported Two or More Races student counts based on states' unique racial/ethnic mix.¹⁰ Therefore, the Two or More Races data are apportioned to the four non-Hispanic race groups (American Indian/Alaska Native, Asian/Pacific Islander, Black non-Hispanic, and White non-Hispanic) based on each group's average share of the combined race total over the three most recent previous years. (Data in the Hispanic category were not part of the apportionment, because Hispanic is considered an ethnicity, not

a race. However, WICHE's research has indicated that some individuals with Hispanic origins may be captured in the Two or More Races data.) An average of three years was used so that any one aberrant year would not unduly influence the apportionment. It is possible that a disproportional portion of the Two or More Races students may be distributed to the student population that is in the majority, e.g., Whites, whether or not it makes conceptual sense. This effect appears to be non-significant in the race projections because of the typically low number of reported Two or More Races students, compared to the other student populations by race.

Ultimately, users should take note that there are subtle differences between the exact definitions of the race/ethnicity categorizations in any given year for the 30 years of data that this edition encompasses. Generally speaking, data including and after school year 2010-11 reflect the categorizations according to the new protocol.

Data in the New Race/Ethnicity Categories: Observations and Limitations

Some of the key ways in which these new race/ethnicity categories interrelate with the projection methodology used in this edition of *Knocking at the College Door* are described below.

All states and jurisdictions were required to begin using the new categories in their reporting by school year 2010-11. However, jurisdictions were not required to conduct a full census of all students in order to re-record or re-tabulate race/ethnicity. Instead, states and jurisdictions may have begun re-recording and tabulating students under the new categories at different junctures, for example when students transitioned between elementary and middle school or switched schools. This would not affect reporting on non-Hispanic students of a single-race category. However, it appears that it could result in some on-going shifts in the data as students are re-categorized at school transitions or for other reasons. This may explain some of the shift seen in the graduate counts of students in the Hawai'ian/Pacific Islander and Two or More Races categories from 2010-11 to 2012-13. This apparent rolling conversion is sometimes even

more evident in the changing distribution in the enrollments counts.

In many cases the first-, second-, and third-grade enrollments, especially for states with smaller populations and therefore more noticeable changes in absolute numbers, appear to reveal a more logical pattern. The number of first graders appears to indicate the relative portion of very young children that will be categorized into the different student populations under the new reporting schema, for example an upward shift of 15 percent more first graders in a given category than in years past. The numbers of second and third graders indicate more typical rates of progression (90 percent to 100 percent advancing year-over-year). This suggests that additional years of data will eventually reveal the more stable patterns and ratios that are necessary for ensuring accurate projections about the coming waves of students. That is, one would expect that several more years of recent enrollment data will show a logical number of fourth, fifth and sixth graders by race/ethnicity. Perhaps more stable numbers and progression rates will also emerge in higher grades.

Sudden shifts have a greater likelihood of being noticeable, or having an impact on the projections, for race/ethnicity categories for which there are a relatively small number of students. For example, historically the number of Asian/Pacific Islander students in Arkansas has been small. But according to birth and school data, between approximately 2005 and 2013, the number of Asian/Pacific Islander first graders in Arkansas was 40 to 60 percent higher than the number of Asian/Pacific Islander infants who had been born in the state six years earlier. This discrepancy could represent either an actual increase of in-migration during this period or an effect of the categorization issues discussed herein, or a combination of both factors. In this case, the ratio that results from the data ends up projecting a similarly high increase in Asian/Pacific Islander first graders. There are, of course, cases of actual, large increases from a small starting population, such as communities that experience a refugee or immigrant influx or states that experience a sudden in- or out-migration due to changes in an industry sector. It is generally

not possible to differentiate all actual changes in youth population from changes in data collection or reporting.

Self-identification and changes over time and between data sources. Users should understand that race/ethnicity are not simply data categories in the public school data, but they also touch upon individuals' self-identity. Research indicates that attempts to categorize individuals in a way that is meaningful for research purposes (e.g., educational or health outcomes) often does not equate to how individuals think of themselves in regards to race/ethnicity.¹¹ Furthermore, self-identity can change over time and under different circumstances. This is particularly pertinent for K-12 school data, which span 12 years. There are also subtle but important differences in the application of the uniform race/ethnicity categories across different data sources. Again, these considerations have less potential to affect non-Hispanic individuals of a single-race category, and more potential to affect individuals with mixed racial/ethnic origins.

The Hispanic category of students encompasses any student with any Hispanic ethnicity, regardless of their race. The primary consideration for making the projections was whether sudden changes in the count of Hispanic students in the year or two surrounding the year of the data change would be projected forward in perpetuity, causing the number of Hispanics to increase implausibly. WICHE observed this effect when preparing the eighth edition of these projections and made adjustments to mitigate it.

In fact, many states report atypically high (20 to 30 percent) year-over-year increases in grade-level enrollments and graduates categorized as Hispanic, in one or more school years between 2008-09 and 2010-11. Not surprisingly, the percentage increases are higher in states that have relatively lower numbers of Hispanic students to begin with. This type of sudden increase is not extrapolated forward, or at least is greatly mitigated, in the projections because the years in which these sudden shifts in the number of Hispanic students occur are given a lower weight when weighting older ratios, thus diminishing the effect. The new OMB category scheme does result in a

greater overall number of public school students to be categorized as Hispanic. For example, the CCD data reported 24,200 more Hispanic graduates for 2010-11 than were projected for that year in WICHE's 2012 projections. Additionally, while the average rate of increase among Hispanic graduates between 2010 and 2025 was projected to be the same as projected in this edition (3 percent annually), there are about 100,000 more Hispanic graduates projected for the Class of 2025 in this edition than were projected in 2012. This is the result of the sheer number of K-12 students now categorized as Hispanic.

The enrollment and graduate counts of students in the Whites category are likely to experience the greatest decline in numeric terms as the new OMB categories shift students previously classified as White into the Hispanics category. In the new schema, any individual indicating "Yes" to identifying themselves as Hispanic will be counted as Hispanic rather than in their respective race category.¹²

Decreases in the number of students categorized as Black have resulted in an apparent stagnation or even decrease in the number of Black public high school graduates, contrary to recent increases in the graduation rates of students in this category. While the available data do not confirm it, this trend appears to be the result of redistribution between race/ethnicity categories. For example, the 2015 Census population estimates indicate that there were 14 percent fewer individuals considered Black by the narrowest racial/ethnic categorization (non-Hispanic single-race Black, which is how Federal education data are reported) than the number considered Black using the less narrow categorizations of "Black only" or "Black in combination with another race" (see Table C.3).¹³ It is easier to see these differences in data that retain and report different categorizations for individuals with multiple race/ethnicity selections, such as the United States Census. There is some evidence of students shifting between categories in the aggregate CCD school data (e.g., multi-origin Blacks being counted in Hispanic or Two or More Races), but it is not possible to isolate it.

Table C.3. 2015 U.S. Census Black Population Estimates

Categorization	Population	% of Total Population
<i>Non-Hispanic</i> "Black Only" (not in combination with another race)	39,925,949	12.4%
<i>Hispanic or non-Hispanic</i> "Black Only" (not in combination with another race)	42,632,530	13.3%
"Black Only" plus "Black in combination with another race"	46,282,080	14.4%

Source: U.S. Census Bureau, Population Division, Annual Estimates of the Resident Population by Sex, Single Year of Age, Race Alone or in Combination, and Hispanic Origin for the United States: April 1, 2010 to July 1, 2015 & Annual Estimates of the Resident Population by Sex, Single Year of Age, Race, and Hispanic Origin for the United States: April 1, 2010 to July 1, 2015.

Decreases in the number of students categorized as American Indian/Alaska Native also appear to be the result of redistribution between race/ethnicity categories, but this cannot be confirmed using available data. In this case, the numerical decreases among the relatively small numbers of American Indian/Alaska Native students appear even more dramatic than those that occurred with the other populations by race, in which large overall numbers dampen the effects of the redistributions between categories. Moreover, research indicates that a greater percentage of American Indian/Alaska Native individuals will shift into the Hispanic or Two or More Races categories than is the case for other races, due to higher rates of multi-ethnic/racial origins among individuals in the category.¹⁴

Several factors limited the usefulness of the available data about the two new race categories for producing reliable, plausible projections, in addition to the sheer lack of student data and corresponding births data necessary for the WICHE projection model. In the four years for which data are uniformly available, the numbers of students in the Hawai'ian/Pacific Islander and Two or More Races categories are often relatively low. But these low numbers were not the primary limitation when attempting to make projections; in fact, in most cases there were more Hawai'ian/Pacific Islander students and students in the Two or More Races category than American Indian/Alaska Native students, which has typically been a low number.

Projections of American Indian/Alaska Native students are possible largely because of longitudinal consistency in the data.

The patterns of the data for students in the Hawai'ian/Pacific Islander and Two or More Races categories are still very unstable, which makes it inadvisable to attempt to make projections from them.

For example, across all states in the four years of available data, almost a quarter of the time there were year-over-year increases of 25 percent or more in the number of students in both the Hawai'ian/Pacific Islander and Two or More Races categories. For example, there might be 1,000 fourth graders in 2010-11 and 1,250 in 2011-12, and up to 1,500 in 2012-13. These implausible rates of increase reflect redistribution from other categories, not rapid population growth. Perhaps even more problematic are erratic patterns of increase and substantial decrease over time in any given grade level.

Having only four years of these data permits only three years of CSR ratios, with attendant substantial instability and no obvious settled pattern. About a third of the time, the ratio of students in a higher grade to the number in the prior grade the year before was more than 110 percent. That is, in many cases, in each

subsequent year the number of additional students increases 10 percent or more in a given grade, creating a multiplier effect and producing implausible numbers of high school students and graduates.

A snapshot of the data aggregated for the United States highlights some of the data limitations while still obscuring the variation in data limitations or robustness that exists state-by-state. Figure C.4 shows the grade level enrollment counts and number of graduates.

To begin, births data do not yet line up with school data because of scheduling variations among the different data sources for transitioning to the new categories. The data suggest a substantial increase in the number of first graders categorized as Hawai'ian/Pacific Islander or Two or More Races, compared to the number of U.S. births in these categories, which could represent either actual in-migration, a lack of correspondence between the categorizations, or some combination of both. Figure C.4 also demonstrates the substantial rates of growth and relative instability in the numbers such as large year-over-year numerical increases by grade and implausible rates of progression, which are highlighted in orange.

Figure C.4. Snapshot of Available Data for New Race Categories, United States

	School Year	1st Grade	2nd	3rd	4th	5th	6th	7th	8th	9th	10th	11th	12th Grade	Graduates

Increase over 1st grade count: 105% 108% 361% 408%

"Two or more races" births data were not uniformly available corresponding to any of the years that school data were available. By the time Two or more races births data were available (for 2010 to 2014), they represented only 40 to 50 percent of the count of Two or more races first graders in the most recent school year (e.g., 75,000 Two or more races births in 2014 versus 148,000 first graders in 2013-14).

Methodological Considerations

Demographic studies generally identify two main sources of population change: natural increase and net migration.¹⁵ The number of school-age youth – and, eventually, high school graduates – is influenced first and foremost by the number of children born, and secondarily by factors such as grade retention and acceleration, net migration between states and schools (in this case, movement between public and private schools), dropouts, early graduations, mortality, and policies and practices).

The projections model changes in birth trends explicitly, while assuming that the implicit influences on enrollments and graduates will carry forward indefinitely. The cohort survival ratios that are used to generate the projections capture these implicit factors as quantified by recent past data and carry them forward into the future projected years. However, this assumption has the greatest potential to degrade the accuracy of the projections should either a new pattern emerge in the preceding year or two, or new circumstances emerge in reality that are not evident in the years of available data.

Under the current methodology, *Knocking at the College Door* estimates the number of first graders based on the number of births that occurred six years prior. WICHE obtains data for live births by state and race/ethnicity from the National Center for Health Statistics, which is part of the Centers for Disease Control and Prevention. Births for 2014 were the latest available data at the time of publication; this establishes the last year for high school graduate projections as 2031-32, i.e., approximately when babies born in 2014 would reach 17 or 18 years of age.¹⁶ While not the principal focus of this publication, birth trends are instructive in their own right because of the significance they play in the projections methodology.

Figure C.5 plots the total number of public and private graduates (both actual reported counts and projections) with births 18 years prior, which corresponds to births between 1989 and 2014. The United States experienced a never before reached number of 4.32 million births in 2007. Birth/fertility

rates then entered a seven-year slide such that there were 384,000 fewer babies born in the U.S. in 2013 than in 2007 (a decline of 9 percent), which becomes evident in the later years of this edition's projections for graduates. There was a slight uptick in births nationally in 2014 (about 56,000 births, or 1.4 percent more births than in 2013-14). But preliminary data indicates that the number of births in 2015 was essentially unchanged from 2014.¹⁷ So there is no evidence of a resumption of previous birth rates at the time that this edition is to be released, and therefore no indication of significant growth in the number of high school graduates in the early 2030s.

Two technical details related to births data are worth highlighting. While the number of births is a fundamentally robust indicator of how many first graders there will be in approximately six years, there are some observed discordances between the number of births and first graders. These discordances can likely be ascribed to nuances in data collection. First, states have been revising birth certificates to the 1997 OMB standards for reporting data on race and ethnicity by expanded categories, as have education agencies. As noted previously, generally individuals with Hispanic ethnicity origins are now counted only in the Hispanic category, and that there are now two new categories for non-Hispanic individuals: White, Black, Asian, Hawai'ian/Pacific Islander, American Indian/Alaska Native, and Two or More Races.

Differences in the timing of the transition to the new OMB standards mean that the data related to births and education have not yet harmonized to the extent needed to produce reliable projections in the new expanded categories. WICHE's CSR methodology requires five years of data in order for the data available for births overlap with the data available for first grade enrollments six years later. Table C.4 shows the small number of states for which birth and school data overlapped, and the years for which these data are available. All states were required to report student data in the new race/ethnicity categorizations beginning in school year 2010-11. In fact, 14 states transitioned to reporting in the new categorizations early, in 2008-09 or 2009-10, but none of these states had also converted their births records by the year that

Figure C.5. Long-Term Graduate Trends Reflect Births 18 Years Prior, 2007-2032

Sources: National Center for Health Statistics, Centers for Disease Control and Prevention and WICHE calculations. 2015 preliminary births obtained from Brady E. Hamilton, Ph.D., Joyce A. Martin, M.P.H., and Michelle J.K. Osterman, M.H.S., "Births: Preliminary Data for 2015," U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, June 2, 2016. Accessed September 6, 2016 from http://www.cdc.gov/nchs/data/nvsr/nvsr65/nvsr65_03.pdf.

would have corresponded to first graders, e.g., 2002 or 2003. Therefore, considering the data available for students and births by the time this edition was published, there were six states with four years' worth of overlapping data, five states with three years' worth, seven states with two years' worth, and three states with only one year of overlapping data. There were no years in which national and regional birth data overlapped, since national births data are computed from the states' births data.

These differences in the timing of the transition to the new race/ethnicity categories in the birth and school data compounded the overall insufficiency of data in the school data alone, making it impossible to produce reliable projections for the new race categories. Therefore, WICHE continues to associate births to school enrollments using the five categories of race/ethnicity that the U.S. Department of Education employed until school year 2009-10 (the insufficiency in the school data and decision to continue producing projections in the long-standing race/ethnicity categories is discussed below).¹⁸

There are certain nuances between relevant data sources, including births data, K-12 student data, and college data worth noting. A specific nuance that relates to the data sources used in these projections is that infants/births are categorized only by the mother's race/ethnicity, whereas school enrollments data are more likely to reflect both parents' race/ethnicity, which may be different from the mother's race/ethnicity alone. Because college planners and administrators are a primary audience for these projections, it is also worth noting that there may also be some differences in the way students are

Table C.4. States by Years of Overlapping Births and School Data

Year Births Records Transitioned to New Race/Ethnicity Categories					
2004	2005	2006	2007	2008	2009
(4 years of overlapping data) Idaho, Kentucky, Pennsylvania, South Carolina, Tennessee, Washington	(3 years of overlapping data) Florida, Kansas, Nebraska, New Hampshire, Texas	(2 years of overlapping data) California, Delaware, North Dakota, Ohio, South Dakota, Vermont, Wyoming	(1 year of overlapping data) Colorado, Iowa, Indiana	Georgia, Michigan, Montana, New Mexico, New York, Oregon, Utah	Remaining 29 states and D.C.

categorized by race/ethnicity among recent high school graduates and in other data related to postsecondary education such as in the Integrated Postsecondary Education Data System (IPEDS). There may be some difference between how individuals are counted in different groupings (e.g., recently enrolled high school graduates versus all college students). And, some difference between data sources of any type may relate to individuals' concept of their self-attested racial/ethnic identity over time and in relation to different circumstances such as college admission and financial aid.¹⁹ Of course, all of these factors have a greater impact in computations when there are a relatively small number of individuals.

With respect to the impact on the projections, theoretically, one would expect that something very close to 100 percent of children born would enter first grade within six years. However, there are cases where the ratio of births to first graders is notably higher or lower than 100 percent; this is particularly true for state and race/ethnicity groupings with low numbers. The ratio of births to first graders has always been subject to some level of effect from interstate relocations, immigration, changes in race/ethnicity categories, early and late enrollment of first graders, homeschooling, and the small but non-negligible rates of childhood mortality. WICHE was somewhat concerned that these data nuances could lead to an over- or underestimation of underlying population changes. WICHE's analysis, however, indicated that the underlying population changes predicted by births are actually tracked quite well in the total number of graduates. Also, for most states, the sum of the students independently projected by race/ethnicity tracks with the underlying population. However, this underlying discordance between race/ethnicity categorizations in the births and school data may have a non-negligible effect in smaller states and race/ethnicities.

Other Factors Affecting CSRs and Projections

Mortality, grade retention, and grade acceleration.

Mortality, grade retention (holding students back), and grade acceleration (promoting students early) impact enrollments and grade progression to varying

extents. More importantly, national estimates indicate that these factors can vary systematically by race/ethnicity.²⁰ However, these data cannot be specifically derived by state, race/ethnicity and grade level. Instead, they are implicitly included in the calculated cohort survival ratios that reflect the various aspects of grade progression. Interested readers can find more detail about child mortality, grade retention, and grade acceleration in WICHE's 2012 *Methodology Review Report*.²¹

Movement and migration. The impact of movement and migration may have an impact on year-to-year enrollment data and ratios. One type of movement is when students transition between public and private schools, which most typically occurs at the junctures between school levels (e.g., when parents shift their children from public to private school at the beginning of ninth grade). The movement between public and private schools is implicitly reflected in the data for public and private school enrollments, but they are not easily discernible from other factors that are in play at the same time (e.g., relatively high rates of retention in the ninth grade), because they occur in relatively small numbers compared to the totals.

More impactful are the migrations of families and students who move between states and who immigrate from outside the United States.²² Recent trends for immigration of foreign-born individuals into the United States are discussed in Chapter 4. Overall, immigration to the U.S. has been down for eight years and will therefore not add to the overall numbers of youth as it had in past decades. Furthermore, there has been some change in the countries of origin for those foreign-born populations that are growing.²³ Patterns vary by state; for example, states with a long history of high immigration are most likely still drawing a large proportion of immigrants to their established immigrant centers. Other regions and states, such as North Carolina, are emerging as new immigrant destinations within the United States.²⁴ And the net out-migration of Mexican immigrants that followed the Great Recession may have been substantial enough in some states to impact enrollments.²⁵

Not an adjusted cohort, as with the official graduation rate.

The cohort survival ratio (CSR) method used to produce these projections does not involve true student cohorts tracked in detail over time; rather, the ratios are simple computations of the number of students in one grade compared to the number in the previous grade the year before. As a result, it is not possible to quantify the precise and individual impacts of various factors such as in- and out-migration, grade retention, and the like. It is important, therefore, to distinguish what the CSR methodology is able to describe about progression through the high school grades, as compared to the official high school graduation rate.

The first school year that all states began using a common, four-year high school graduation rate in accordance with U.S. Department of Education requirements was 2010-11. The varying methods that had previously been used by states to report graduation rates made comparisons between states unreliable. The new common metric, called the “adjusted cohort graduation rate” (ACGR, also known as the “on-time graduation rate”), reflects the number of ninth graders entering that grade for the first time who graduate four years later, adjusted for students who transfer in or out, emigrate to another country, or die over the four years. The new, uniform rate calculation is not comparable in absolute terms with previously reported rates (2009-10 and prior), although some states did track ACGR graduates and graduation rates prior to 2010-11.

Table C.5 illustrates the difference between the national official graduation rates (ACGR) for recent years and a simple computed ratio of 12th graders in the graduating year and ninth graders counted at the beginning of the school year four years earlier, derived from the data used for these projections.

With the exception of Asian/Pacific Islanders, the computed ratio appears to suggest higher attrition between ninth grade and graduation than the AGCR data. However, the lower computed ratio could result from a number of factors, for example the fact that the count of graduates used for these projections encompasses all high school diploma recipients from

Table C.5. Comparison of Official Graduation Rate and Computed Ninth-to-Graduation Ratios

	Official Rate (ACGR)	Computed Ratio
Total Public Schools	81.40	77.67
American Indian/ Alaska Native	69.70	63.09
Asian/Pacific Islander	88.70	92.00
Black	70.70	64.00
Hispanic	75.20	72.95
White	86.60	84.14

that school year, including early and late graduates, not just those who graduated in four years after ninth grade. It could also be the result of students who transferred between public and private schools before graduation (the comparable private school graduation rate is unknown and not included). This demonstrates that while the *Knocking at the College Door* CSR methodology and the underlying data implicitly capture enrollment and graduation patterns, it is generally not possible to precisely quantify or isolate specific effects within them.

Policy effects and other external factors. Finally, educational policies and other relevant external factors may also affect the data and resulting ratios used for these projections.

Economic and external factors. The most obvious and widespread external factor that likely affected enrollment and graduation patterns in the 2012 edition of projections, and which continues to affect the data used in this edition, has been the recent Great Recession and the subsequent slow return to economic growth and restructuring of the labor market. Although the 2012 edition was published when the recession had been declared officially over and the recovery was underway, the data available to produce those projections were from school years 2004-05 to 2010-11, which meant that the 2012 edition largely reflected pre-recession trends. The state of the economy might have led some students to remain in school and or led to different patterns of in- and out-migration, among other things. The

data available for this edition of projections are still substantially lagged (enrollments from school years 2009-10 to 2013-14 and graduates from school years 2008-09 to 2012-13), but they are probably more reflective of the current economic reality, which is largely very similar to the economic patterns of the past several years in many states that continue to experience relatively slow recovery. It is the case with each new edition of projections that the available data are better able to predict short-term trends. Specifically, the births and school data available for this editions might not as precisely predict medium- or longer-term trends, particularly if the economy recovers rapidly and substantially in the near future (in fact, some states have already realized significant economic recovery, the effects of which might not be reflected in the data for these projections).

WICHE's research also indicates that some of the unexpectedly strong growth/retention in enrollments and graduates in recent years may be related to this federal immigration policy, implemented in 2012, that provides temporary relief from deportation and a two-year work permit to certain individuals who were brought to the U.S. illegally as children. In particular, the DACA education requirements may be a strong, additional incentive for certain youth populations to remain in school and graduate.²⁶ It is not possible to quantify this effect, but for example, over 1 million DACA requests were accepted between 2012 and 2014, the highest numbers being from states with large immigrant populations.²⁷ Some states have also recently received and are hosting notable numbers of unaccompanied minors from Central and South America, which are more likely to have impacts locally.²⁸

Education policies and practices. Educational policy and practice innovations presumably affect student and graduate patterns more directly. Changes to graduation and high school course-taking policies are likely to have the most immediate, direct effect on these high school graduate projections. But other changes that affect earlier grades may be subtler and show up over the longer term. For example:

- ▶ *Implementation of major new curricula and exams such as the Common Core.* Effects from curriculum change are unlikely to be immediate in most cases, and may only become evident over several editions of these projections. But, one specific related example is the elimination of the California High School Exit Examination (CAHSEE) due to a misalignment of the test and the recently implemented Common Core standards. Beginning January 1, 2016, no student in the state of California is required to take an exit examination, including those in adult education courses. Furthermore, any student whose only outstanding graduation requirement was the passing of CAHSEE is now immediately eligible to receive their high school diploma.²⁹ It is unclear exactly how many more students will graduate each year and how many will retroactively graduate (one estimate states that about 249,000 students have failed the test since it became a graduation requirement in 2006, about 6 percent of the test takers in that time).³⁰ But there are likely to be more graduates in California than projected as this exemption takes effect.
- ▶ *Expansions of dual/concurrent enrollment opportunities.* States may expand opportunities for dual and concurrent enrollment in order to provide an incentive to remain in school, or extend these opportunities to additional new student populations.³¹
- ▶ *Monitoring and metrics.* It is possible that more accurate student tracking through the increasing use of state longitudinal data systems may have led to numeric effects in the Common Core of Data.³² Along these lines, it appears the transition to the uniform official graduation rate may have had some effect on the number and type of diplomas awarded and counted in the data used for these projections.³³
- ▶ *Every Student Succeeds Act (ESSA).* Any discernible effect of ESSA – for example, the effect of the decision to shift funding formulas in order to allocate more funds to schools with higher relative proportions of students below the poverty line – will begin to emerge in the next edition of the projections at the earliest, as it is targeted for implementation in school year 2017-18.

Data Sources and Notes

This section provides specific information regarding the sources of data used in this publication, detailed notes and observations about the raw data, and any adjustments made to these data.

Births

WICHE obtained data for live births from the National Center for Health Statistics and Prevention, which is part of the Centers for Disease Control. The data were acquired through the VitalStats table builder (<http://205.207.175.93/VitalStats/ExtractViewer/extractView.aspx>). Births data were grouped according to the mother's state of residence (MRSTATE), mother's Hispanic origin (UMHISP), and mother's race (MRACEREC or MRACE4, as available by year). For this edition, WICHE acquired births data for 2011 to 2014 and added them to births data used for previous editions; the last available data were for 2014 births by state and race/ethnicity.

The births data are considered final, so adjustments were generally not made to the values obtained. However, due to new suppression rules for the publicly available births data, it was necessary to impute a small number of values. Counts of 10 or fewer and higher-level counts built from these counts were suppressed. WICHE derived the missing values based on the difference of totals and subcategories, as described in Table C.6. In recent years, race/ethnicity was "not stated" for between 0.6 percent and 0.9 percent of births, so these data were not used because there was no information for distributing them between the Hispanic and race categories.

Public School Data Notes

All public school data were obtained from the Common Core of Data (CCD), which is maintained by the National Center for Education Statistics (NCES), part of the U.S. Department of Education.

Data for graduates prior to 2009-10 and for prior years' enrollments are those that were published in the 2012 edition of *Knocking at the College Door* and maintain the data adjustments made for that edition. Many are republished in this edition for historical perspective.

Table C.6. Estimation of Suppressed Births Counts

States/Years	Estimation Method
U.S. Total (2012, 2013)	The state total was suppressed due to suppression of a Hispanic "Not Stated" value less than 10. So, the state total was computed as the sum of Non-Hispanic and Hispanic births.
Alabama (2012)	
Hawai'i (2014)	
Iowa (2013)	
Maine (2014)	
Idaho (2013)	The state total was suppressed due to suppression in underlying Hispanic nationality categories. So, the state total was computed as the sum of Non-Hispanic and Hispanic births.
Maine (2012)	
Montana (2012, 2013)	
Vermont (2012, 2014)	
West Virginia (2012, 2013)	
Wyoming (2013)	
Maine (2013)	The Hispanic total and state total were suppressed due to suppression in underlying Hispanic nationality categories. So, the Hispanic total was obtained from National Vital Statistics publications about final births, ³⁴ or computed based on all available unsuppressed counts in the Hispanic nationality categories, variably. Then the state total was computed as the sum of Non-Hispanic and the computed value for Hispanic births.
Idaho (2013)	
Mississippi (2012)	
Montana (2014)	
North Dakota (2014)	
South Dakota (2012, 2014)	
Vermont (2013)	
Wyoming (2012, 2014)	
Delaware (2012, 2013, 2014)	The Non-Hispanic American Indian total was estimated as 9 since it was suppressed in the available data for being less than 10.
D.C. (2013, 2014)	
New Hampshire (2012, 2014)	
Vermont (2012, 2014)	
West Virginia (2012, 2013)	

Note: The difference from an actual total should be in the magnitude of 10 or less, by definition, since suppression occurs for values of 10 or less.

At the time of publication, the most recent available CCD data were for enrollments through school year 2013-14 and graduates through 2012-13. WICHE obtained the statewide grade-level enrollment counts from the publicly available datafiles at <https://nces.ed.gov/ccd/stnfis.asp>. The 2009-10 graduates were obtained from the publicly available datafile at <https://nces.ed.gov/ccd/drpcompstatelvl.asp>. Since the graduates data were not available past the school year 2009-10 in datafile format, the statewide counts for graduates/diploma recipients were obtained from the *Digest of Education Statistics* online data tables:

- ▶ Table 219.32. *Public high school graduates, by sex, race/ethnicity, and state or jurisdiction: 2010-11*, at http://nces.ed.gov/programs/digest/d14/tables/dt14_219.32.asp
- ▶ Table 219.33. *Public high school graduates, by sex, race/ethnicity, and state or jurisdiction: 2011-12*, at http://nces.ed.gov/programs/digest/d15/tables/dt15_219.33.asp
- ▶ Table 219.32. *Public high school graduates, by sex, race/ethnicity, and state or jurisdiction: 2012-13*, at http://nces.ed.gov/programs/digest/d15/tables/dt15_219.32.asp

Therefore, the public school enrollments projections begin with school year 2014-15 and the high school graduate projections begin with school year 2013-14.

The data were reviewed for anomalies and compared with state-published data on nonpublic school enrollments or graduates, where this information was available. In carefully reviewing these data, WICHE noted a number of nuances but limited its data adjustments to cases in which there were obvious discrepancies – for instance, if the number of public graduates was the same as the number of graduates of a single racial/ethnic group, or if a data point for one year was substantially different from adjacent years. The data were reviewed with the expectation that there might be some perceptible effects of the race/ethnicity re-categorization discussed in the *Methods* section; where a given change appeared to repeat in subsequent years, it was typically not considered a data error.

It had been the case more frequently in prior years that the state public schools' totals did not always equal the sum of the five racial/ethnic categories – for example, because a state tracked additional categories that were not covered by the five CCD categories (e.g., California, Georgia, and Ohio). This difference appears to have diminished in recent years' data, but it may be observed in the historical reported counts presented with the projections. This difference may also occur if data in data were suppressed, as is typically done for low counts, or for other unknown reasons.

Information about any data adjustments, pertinent data notes from NCES documentation about the data files, or adjustments to the projection methodology to mitigate anomalous patterns are noted for each state in Table C.7.

Definition of high school graduate. High school graduates are those reported as regular diploma recipients. The CCD defines a regular diploma as the high school completion credential awarded to students who meet or exceed coursework and performance standards set by the state or other approving authority. What a high school diploma represents varies across states. Neither GED recipients nor recipients of alternative diplomas or credentials are included in these data, and detailed data are not available to fully account for the number of GED or other diploma equivalents nationally, let alone by state. But, for example, there were about 537,600 GED passers in 2013, 22 percent of which were between 16 and 18 years old (about 120,400).³⁵ In 2014, there were about 20,000 completers of the HiSET exam (an alternative to the GED), but data by age are not available for these students.³⁶ Likewise, no data are available for the specific number of students who completed and passed the TASC exam (another alternative to the GED).

Bureau of Indian Education schools. The CCD allows for the Bureau of Indian Education (BIE) to report data about the schools under their authority, however the BIE did not report the data for most years. WICHE's research indicates that students enrolled in BIE- and tribally-operated schools educate between 8 and 10 percent of all American Indian/Alaska Native youth, representing about 40,000 students within 183 schools in 23 states. In 2012-13, the states with the highest number of schools serving 70 percent of BIE-educated youth nationally were Arizona, New Mexico, South Dakota, and North Dakota. Other states where American Indian/Alaska Native students are most highly concentrated are Oklahoma, California, and Alaska, but it appears that most of these students are included in the public-schools data. The necessary data were not available to add to the data used for the American Indian/Alaska Native projections.

Private School Data Notes

The Private School Universe Survey (PSS) is a biannual survey conducted in odd years by NCES and provides

data for religious and nonsectarian private/nonpublic elementary and secondary schools in all 50 states and the District of Columbia. Details concerning the PSS methodology are available on NCES's website (<http://>

Table C.7. Public School Data and Methodology Adjustments

State	Enrollments	Graduates
California		California did not report graduation data for 2008-09 to the NCES Common Core of Data, so NCES imputed graduates at the state level such that the prior year's graduation rates were maintained at the race/ethnicity level.
Connecticut		For school year 2009-10, NCES imputed graduation data at the state level based on prior-year rates because reported values were "excessively high."
Georgia	According to the NCES data notes, the State Education Agency (SEA) did not report magnet schools in 2013-14. The SEA indicated that it would revise its magnet data, but these revisions were not made in time to be included in the CCD files used for these projections.	
Hawai'i	A sudden but apparently real doubling of Hispanic first- and second-grade enrollments in 2012-12 and 2013-14 in combination with sudden increases in the grade progression ratios led to implausible, additive inflation and to a tripling of the number of first graders graduating in 17 years. Hawai'i data officials confirmed that the enrollments counts were actual, and likely a result of the data recategorizations and real enrollment growth. Therefore, WICHE used the rates of progression between first and twelfth grade that were observed up through 2008-09, before the category change, and let the observed rates of increase in first and second grade enrollments flow forward, resulting in a more plausible increase.	
Louisiana	Hispanic enrollments decreased by about 20 percent between 2009-10 and 2010-11 in all grades, and then increased more than 40 percent between 2010-11 and 2011-12 in all grades. All Hispanic enrollments for 2010-11 were linearly imputed.	
Maine		For 2008-09, Maine reported data for some semi-private schools that receive more than 60 percent of their funding through public sources (1,419 diplomas awarded to students from those schools).
New Hampshire		According to NCES data notes, New Hampshire misreported its Black and Hispanic graduate counts for 2008-09. The graduate counts and associated rates for New Hampshire's Black and Hispanic students were to be corrected on an upcoming data release, but none was available by publication.

State	Enrollments	Graduates
New York	According to NCES data notes for 2013-14 enrollments data, on all three levels (state, LEA, and school) the SEA reported zero Hawaiian Native/Pacific Islander students in 2013-14 although over 5,000 students were reported in this category at all three levels in 2012-13. The SEA offered no explanation. It is possible these students are being counted in the Two or More Races category. This count increased from approximately 33,500 (all three levels) in 2012-13 to over 40,400 (all three levels) in 2013-14.	
Ohio	Observed 10-15 percent decreases in grades 11 and 12 for 2010-11 and 2011-12, primarily attributable to similar changes in White enrollments. Insufficient information or data was received in order to confirm whether these were real/actual decreases or to make adjustments to the data.	
Tennessee		There were no counts for graduates/diploma recipients in the Two or More Races category in any year.
Vermont	According to NCES data notes for the 2013-14 enrollments data, the school- and district-level counts do not match statewide counts, due perhaps to differences in funding source.	

Note: If a state is not listed, no data adjustments were made.

nces.ed.gov/surveys/pss). Response rates for the PSS are high and its data can be disaggregated by state as needed for these projections. These data do not cover students homeschooled without classroom instruction.

PSS data for enrollments and graduates through and including 2008-09 are those used in the 2012 edition of *Knocking at the College Door*. PSS enrollments obtained for this edition came from the 2011-12 survey data files (PSS1112) available on NCES's website (<http://nces.ed.gov/surveys/pss>), which was the latest year of data available at the time of publication. For that administration the response rate nationally was 92 percent.³⁷ This file provided enrollments for school year 2011-12. Graduates data are not provided in the PSS enrollment data files, so they were obtained from NCES's PSS Data Table 15, which details the number of private schools, students, full-time equivalent teachers, and high school graduates, by state and academic year.³⁸ As with the CCD public school data, graduates in the PSS data are lagged and refer to the preceding academic year, so Table 15 provided graduate counts for school year 2010-11. As

such, projections for private school graduates begin with school year 2011-12, two years lagged from the public school projections.

The data were reviewed for anomalies and compared to state-published data on nonpublic school enrollments or graduates where this information was available. Information about any data adjustments or sources other than PSS data, or adjustments to the projection methodology to mitigate anomalous patterns, are noted for each state in Table C.8. Most anomalies were observed in states with low student counts for private schools, and therefore the projections for these states may be considered tentative or estimated.

Because the PSS data are collected every other year, enrollment counts for grades 1 to 11 for years between PSS administrations are linearly imputed. Grade 12 enrollment counts are provided in the PSS data for all years from PSS survey question 9b, which requests the number of students enrolled in the 12th grade around October 1 of the prior academic year, which

corresponds with the number of graduates reported for that same (prior) academic year. Graduates for any given intervening year were then estimated by applying the average of the 12th-grade-to-graduation progression ratios for the adjacent years to the number of 12th graders for the academic year of interest.

Data Notes for Puerto Rico and Guam

Guam. WICHE used a combination of NCES CCD data (which were generally incomplete) and data provided upon request from the Guam Department of Education and Department of Education of Guam Annual State of Education Report (ASPER) to produce the projections for Guam. Only the necessary data to produce projections for Guam overall public school students and graduates were available. The available data for total public school enrollments and high school graduates were generally steady except for observed anomalies in the number of high school graduates compared to 12th graders beginning in school year 2011-12. The count of Guam public high school graduates through 2011-12 was 92 percent of the reported 12th graders, on average. Beginning and after 2011-12, the number of reported public high school graduates was 106 percent or more of the 12th graders. Using the original graduates counts for these years would cause the projections to be as much as 15 percent higher than observed in the prior years, which appeared anomalous. Therefore, the enrollments counts and rate of progression/graduation from 12th grade in the five years prior to the observed data anomalies (2006-07 to 2010-11) – which ranged from 85 to 98 percent and averaged 92 percent – were

used to estimate the number of graduates in projected years.

Puerto Rico. A combination of NCES CCD data, which were generally incomplete, and data obtained with the assistance of the Puerto Rico Institute of Statistics and Department of Education of Puerto Rico were used to make the Puerto Rico projections.³⁹ Only the data necessary to produce projections for Puerto Rico overall public school students and graduates were available. Specifically, definite counts of all standard high school diploma recipients, uniformly, in each year, were not available. Data for some years included only on-time graduates and in other years may have included non-standard diploma recipients (e.g., high school equivalency exam passers and special schools). So, the enrollments data and the rate of progression/graduation from 12th grade in the five years prior to the observed data anomalies (2005-06 to 2009-10) – which ranged from 88 to 97 percent and averaged 93 percent – were used to estimate the number of graduates in projected years.

Commonwealth of the Northern Mariana Islands. The necessary enrollments and graduates data were not available to attempt projections.

Table C.8. Private School Data and Methodology Adjustments

State	Enrollments	Graduates
Iowa	Grades 9 to 12 enrollments for 2010-11 were interpolated proportionate to prior years because they were reported as double to triple in number compared to prior years.	Graduates for 2009-10 and 2010-11 were derived using a five-year historical average of 2005-06 to 2008-09 grade-12-to-graduates progression ratios, because these data were not provided in NCES Table 15 due to “reporting standards not met.”
Wyoming		Due to data unavailability, most years of graduates prior to and including 2010-2011 graduates are derived and reflect an average rate of 95 percent grade-12-to-graduation ratio.

Note: If a state is not listed, no data adjustments were made.

⁵ In addition, graduates for California were imputed by NCES in the CCD, because the state did not report them. Robert Stillwell, Jennifer Sable, Christopher Plotts, and Amber Noel, "NCES Common Core of Data State Dropout and Completion Data File: School Year 2008-09," U.S. Department of Education National Center for Education Statistics, 2011, accessed October 13, 2016, <http://nces.ed.gov/ccd/pdf/INsdr08gen1a.pdf>.

⁷ WICHE attempted to obtain more recent data through the NCES staff listed on the website and through the WICHE staff's network of professional contacts. WICHE held off considering the projections final until the last possible moment (mid-September 2016), past which it would not have been possible to release the projections by early December 2016. NCES released several *First Look* reports and graduation rates for school year 2014-15 in the first part of October 2016, which suggested that new data were imminent. But as of October 18, 2016 (after most states' Fall student count dates for the 2016-17 school year), the latest CCD enrollments and graduate data available were for school year 2013-14 and 2012-13, respectively.

⁸ Where the state-sourced data are sufficient to produce projections by race/ethnicity, the difference between the simulated and official projections has some additional dispersion, but it appeared generally in line with what can be seen in WICHE's Historical Accuracy analysis.

⁹ Only the public school student data from the CCD uniformly include race/ethnicity detail; private school data from the Private School Survey do not include race/ethnicity detail in the grade-level enrollments or graduate data. Therefore, all references to students by race/ethnicity refer to public school students only.

¹⁰ WICHE consulted multiple sources to determine whether there is a commonly accepted method for bridging the multiracial data to prior categories. While there is official guidance about methods for distributing multiracial individuals into the distinct categories when the data are available in individual-record form, there is none for distributing them based on aggregated data, such as CCD. For one recent example of NCES reporting using 2008-09 CCD data, see Chris Chapman, Jennifer Laird, and Angelina KewalRamani, *Trends in High School Dropout and Completion Rates in the United States: 1972-2008*, NCES 2011-012, Washington, D.C.: National Center for Education Statistics, Institute of Education Sciences, U.S. Department of Education, 2010, accessed March 31, 2012, <http://nces.ed.gov/pubs2011/2011012.pdf>.
